The meeting arranged that a deputation should be appointed by the Irish Medical Committee to wait on the Local Government Board, and that it should make strong representation to this Board to take the necessary steps:

(1) To fix or regulate the salaries of all Poor Law medical officers. (2) To introduce a bill in Parliament providing compulsory superannuation for Poor Law medical officers, and to urge, if possible, a provision for an increase in the superannuation of retired Poor Law medical officers. (3) To make alterations in the present system of sworn inquiries so as to protect the medical officers from frivolous and malignant accusations and their undue publicity. (4) To make changes in the rules for the presentation of tickets for medical relief.

Pledge.

The delegates having all signed the following pledge the meeting directed that secretaries of local medical committees take steps to have it signed by all the doctors residing in the areas covered by their committees:

That in case it should be necessary for any doctor to resign his appointment for the betterment of his position, I promise not to apply for or to accept his appointment, or to act as locumtenent in his district as long as it is vacant.

England and Wales.

MATERNITY NURSING IN LONDON.

A CONFERENCE on maternity nursing, arranged by the Central Council for District Nursing in London, was held on June 4th under the presidency of Sir William Collins, M.P., with whom was Sir Arthur Downes. The points for discussion were—

1. To what extent is it desirable and practicable that maternity nursing should be undertaken by district nursing associations in London?
2. The relation of maternity nursing to midwifery, and, in particular, whether it is essential that the maternity nurse should hold the C.M.B. certificate.
3. The question of co-operation with the hospitals for the purpose of nursing the extern maternity cases.

As these three subjects were taken together the discussion was somewhat disjointed, and all resolutions were ruled out, as it was not desired to tie the council's hands, but merely to elicit a free expression of opinion. With regard to the first point, Sir Arthur Newsholme, after detailing what the Local Government Board had done, said that the Board had no intention to supersede the work of the voluntary associations. The second point was the one which gave rise to most discussion. Sir Francis Champneys expressed the view that it was absolutely essential, if any scheme was to be successful, that the private practising midwife should be retained. He was convinced that poor women would not consider that any official, however competent, stood in the place of the women of their choice. In doctors' cases his view was that the nurses should not be midwives. With regard to the third point, Dr. Lauriston Shaw expressed the opinion that the hospitals would welcome any effort on the part of nursing associations to help their extern maternity departments. Some had provided nursing sisters in sickness, but not maternity nursing to any large extent. A large number of other speakers took part in the discussion, including medical men and women, practising midwives, and members of district nursing associations; and in summing up the various expressions of opinion Sir William Collins said that the interchange of views had been valuable. The ideal in all minds was to secure that no parturient woman should be unattended or inadequately or improperly attended. On the first of the specific points before the conference he had heard no negative opinion expressed, and the third point also as to co-operation with the hospitals had brought out no disagreement. It was really with regard to the second question that divergence of view was to be noted. The midwife had a great past, and would perhaps have a great future, but the fully qualified nurse was not disposed at the present time to work under a midwife who had had six months' training. Could the midwife be trained so as to become the equivalent of the obstetrician, and could a

midwife be expected to supply all the maternity nursing that her own case required? He gathered that Sir Francis Champneys's opinion was that this was hardly possible. A record would be kept of all the remarks and suggestions made at the conference, and a full report would be made to the Central Council, who would give it most careful consideration.

Correspondence.

PRECAUTIONS AGAINST THE SPREAD OF MALARIA.

SIR,—Your leading article (May 25th, p. 595) on the precautions which should be taken against the possible spread of malaria in this country is timely. The anopheles mosquito is always with us, and, if infected, as it may be, by the return of malaria-stricken soldiers, we may be faced by a problem of great magnitude.

Fortunately we can never suffer as in Cromwell's day, for Ronald Ross—*parvaque pars fuit*—has laid the foundations on which we should build. But the lesson has been imperfectly learnt and the traditions of forty years ago die hard. Constantly, in my consulting-room, I hear the old heresies stated, and even many medical men still adhere to the massive doses of quinine which are traditional in the tropics. Captain Yeates's letter, therefore, is a valuable contribution to the sum of our information. I agree with him most emphatically as to the evils wrought to the digestive organs by the administration of excessive doses of quinine. Many a man may be free from fever so long as his digestive functions hold out, but succumbs after an initial attack of gastritis induced by quinine and followed by anaemia and cachexia. In tropical countries the liver is prone to congestion, and one would naturally ask why its disabilities should be further increased by excessive dosage with quinine. Surely it would be more reasonable to give calomel in appropriate doses and to limit the doses of quinine to the lowest possible amount compatible with efficiency.

The effective dose of quinine varies with the individual, the environment, and the degree of exposure. But in Macedonia (1916), where a malignant malaria is prevalent, I never found it necessary to resort to the heroic doses I still find advocated by some physicians. The War Office recommend 60 grains a week—roughly 10 grains a day—this in my experience is not only excessive but positively harmful.

The malarial parasite is susceptible to quinine only in its earliest stages of development. The more mature forms are entirely uninfluenced. To drench, therefore, a man with quinine in the hope of perchance catching the parasite in its earliest stages is unscientific. If quinine upsets the digestion, congests the liver and reduces the natural resistance of the patient, then quinine, improperly given, may be an evil rather than a benefit.

I have found in West Africa, India, Burma, Malay States, Japan, and in Macedonia under war conditions, that 5 grains once a week is an adequate prophylactic dose. But if one is so unfortunate as to be exceptionally exposed then an extra dose of 5 grains is probably advisable as an additional precaution.

In cases of malaria the most favourable time to give quinine is, if it can be detected, the moment when the temperature is about to rise, for then the parasites are in their youngest and most susceptible stage; at this time only can quinine be of value. If this moment is missed, as it easily may be, no quinine should be given until the pyrexia has reached its height and is about to fall. The patient meanwhile may be immensely comforted by small doses of phenacetin. Quinine given with a rising temperature only tends to increase headache and malaise.

The salt of quinine employed is not a matter of indifference. The sulphate is less soluble and more irritating than the hydrochloride and much less easily absorbed. For years I have used only the hydrochloride. In one striking case from Mexico I found the hydrochloride entirely successful after months of treatment by the sulphate had proved ineffectual.

All who had experience in Macedonia would testify that many lives were saved by hypodermic injections of

quinine when all other methods of administration had failed.—I am, etc.,

R. FIELDING-OULD, M.D., M.R.C.P.

London, S.W., June 3rd.

PROTEIN "SHOCK" THERAPY.

SIR,—The leading article in the JOURNAL (June 1st) is timely, and invites a few observations. The article conveys the impression that the reaction or shock is exclusively produced by the injection of protein, whereas it is also capable of production by non-protein substances. This indicates that the reaction is not due directly to the substance introduced. For this and other reasons I suggested the term "pyrogenic therapy" in a paper on this subject published in the JOURNAL of February 16th, 1918 (which, so far as I know, is the only one hitherto published in this country). Therapeutically considered, there is no benefit without the rise of temperature. As to your view that much more investigation is needed, this is very true in the general sense, but I would submit that the scientific basis of the treatment is quite as well established as that of any other treatment, and a good deal better than some. It consists in the desensitization or immunization of the patient at a single stroke.

There is no conflict between the new treatment and the practice of specific artificial immunization. Their modes of action differ in a manner now fairly well understood, but that is too wide a subject to discuss here. Long ago Woodbridge demonstrated that tissue fibrinogen could confer an immunity against anthrax which was quite as effective as that obtained by bacterial inoculation. There is a certain class of cases, not amenable to specific immunization by small graded doses, which are rapidly cured by the new treatment, irrespective of the organism or organisms present. As you state, the clinical results are "surprising," and difficulties in regard to the correct understanding of the process should not deter medical men from conferring these benefits on their patients. Indeed, so far as I can gather, ours is about the only country in which the treatment is being neglected. It certainly demands care and skill on the part of the doctor, but what treatment worth anything does not?—I am, etc.,

London, W., June 7th.

A. G. AULD.

ADAPTATION AND DISEASE.

SIR,—In reference to the controversy between Professor Cunningham and Professor Adami on priority in the view that the mechanism of heredity is rather chemical than particulate (BRITISH MEDICAL JOURNAL, pp. 632, 658), I ask permission to quote the following passage:

Concerning the *modus operandi* we know nothing; the phenomena may be due, as Hering suggests, to molecular vibrations, which must be at least as distinct from ordinary physical disturbances as Röntgen's rays are from ordinary light; or it may be correlated, as we ourselves are inclined to think, with complex chemical changes in an intricate but orderly succession.—*Natural Science*, 1893.

The essay in which this occurs is reprinted as it stands (save for correction of press errors) in my *Problems of Life and Reproduction*, 1913, with an added footnote:

This view is essentially the same as that developed by Delage in his *Théorie des Causes Actuelles* (l'Hérédité, p. 7) and by J. T. Cunningham in his *Hormone Theory of Heredity*.

I confess to a feeling of disappointment that my position next to others should not have been recognized in your columns.—I am, etc.,

Cork, June 11th.

MARCUS HARTOG.

VINCENT'S ANGINA.

SIR,—In the JOURNAL of February 2nd, 1918, page 160, in a letter on Vincent's angina, Major Bowman, C.A.M.C., asks you to publish "finally when and where the first observations on this disease were made as occurring amongst British troops." From the context it would appear that Major Bowman is under the impression that Vincent's angina was first observed in British troops during the present war. The disease was frequently observed amongst the troops, especially young soldiers, at Woolwich, from the autumn of 1907 to the spring of 1912, about four and a half years, during which time I was clinical pathologist at the Royal Herbert Hospital.—I am, etc.,

J. COWAN,

Lieut.-Colonel R.A.M.C.

Station Hospital, Jubbulpore, C.P.,
April 10th.

Obituary.

THE RIGHT HON. ROBERT FARQUHARSON, P.C.,
M.D., LL.D.,

Formerly M.P. for West Aberdeenshire.

WITH deep regret we announce the death of Dr. Robert Farquharson, which occurred at Finzean House, Aboyne, Aberdeenshire, on June 8th. He was born at Edinburgh on June 21st, 1836. His father, Dr. Francis Farquharson, the second of a generation of doctors, is described as a man of good physique and of exceptional ability. He gained a considerable reputation as an ophthalmic surgeon, and was on the staff of the Eye Dispensary, where he had among his pupils Sir Charles Tupper, afterwards Prime Minister of Canada. His wife, Alison Mary Ainslie, daughter of an intimate friend of Robert Burns, was a celebrated beauty in her day. Robert received his literary education at the Edinburgh Academy, and entered the University of Edinburgh as a medical student in 1854. He had among his teachers John Goodsir, Hughes Bennett, Simpson, Syme, whose dresser he was, Christison, Gairdner, Warburton Begbie, and Matthews Duncan. After taking the L.R.C.S. he graduated M.D. in 1858, the subject of his thesis being the parasitic diseases of the skin, with special reference to treatment by epilation. He entered the Army Medical Service, and was first attached to the Royal Artillery, from which in 1859 he was transferred to the Coldstream Guards. After nine years' service with that distinguished regiment he was appointed medical officer to Rugby School, of which Dr. Temple was then the head. When Temple became Bishop of Exeter in 1869, Farquharson, "not caring much for the new régime," determined to seek his fortune in London. Before settling down he visited the medical schools and hospitals of Berlin and Vienna, and shortly after his return became assistant physician to St. Mary's Hospital and lecturer on materia medica at the medical school. In 1875 he succeeded Dr. Cheadle as physician to the skin department, and two years later became physician to out-patients. He was elected F.R.C.P. in 1877.

Francis Farquharson on becoming Laird of Finzean in Aberdeenshire threw up medicine. The estate covers 16,900 acres and includes Lumphanan, where, according to tradition, Macbeth was slain. When Robert Farquharson became laird on his father's death in 1878 he, too, abandoned the profession and retired from St. Mary's Hospital. He was elected M.P. for West Aberdeenshire as a Liberal in 1880, retaining his seat till 1906. He did very useful work in the House, where, as he modestly says, he eventually gained a kind of position as an authority on matters medical and scientific. Whenever he rose to speak on such subjects he was invariably called. He always spoke on the Army Estimates and was instrumental in securing substantive rank for medical officers. He strongly advocated the better feeding of recruits. When after the Boer war Mr. Burdett-Coutts attacked the Army Medical Department the Government did not see fit to defend the doctors and asked Farquharson to move the adjournment. He was fully prepared for the fray, but to his deep disgust his motion was blocked. The lunacy laws gave him the opportunity for an annual speech in which he never lost an opportunity of contrasting the Scottish arrangements with the English, to the disadvantage of the latter. He took an active part in the promotion of cremation, and once produced for the edification of the House a small hottle containing the ashes of a cow to show that this method of disposing of the dead is a clean and even artistic process. Farquharson served on a number of important Committees—on the Contagious Diseases Act, the Midwives Bill, the Shop Hours Regulation Act, the ventilation of the House, and other sanitary and medical questions. For six years he was Chairman of the Private Bills Committee, which gave him a kind of official status. But what he considered the crowning honour of his parliamentary career was his unanimous election as chairman of the Scottish Liberal party, a position which he held till his retirement.

When Farquharson retired from Parliament after a quarter of a century's service he found consolation in a distinction which he highly valued—the Privy Councillorship bestowed on him in 1906. The high regard in which he was held by his political associates is well expressed in

a letter written by Sir Henry Campbell-Bannermann to Mr. Eugene Wason:

The little troop of honest Scots will not seem itself in future without "The Doctor." His genial temperament, his courteous and kindly demeanour, his cheerful spirit, his keen interest in all public affairs, which was guided by a good share of natural common sense—these good qualities attracted the affection of us all. We are infinitely sorry to lose him from among us.

Robert Farquharson was a staunch but moderate Liberal, always earnest in the promotion of what he believed to be sound reforms, but cherishing no illusions as to the advent of the millennium through the action of politicians. He made no pretence to oratory, but could say what he meant in telling, if homely, speech. He was very successful as a speaker at by-elections. He was a picturesque figure, whether in the sombre raiment of civilized life in the House, or in the kilt as the chieftain on his ancestral heath. His walrus-like moustache made him a tempting subject for the caricaturists, but there was no touch of malice in their handling. He was popular with every section of the House, and at Finzean he entertained many persons of distinction in various spheres of achievement. He was not much of a sportsman, but could take his place in a shooting party without disgrace.

Farquharson took a great interest in the work and prosperity of the British Medical Association, and was a frequent attendant at its annual meetings. In his early days in London he was joint secretary with Dr. Patrick Stewart of the Metropolitan Counties Branch, and secretary of the Section of Medicine at the annual meeting held at Sheffield in 1876. He was afterwards president of the Aberdeen Branch in 1898–1899, and vice-president in 1900 and 1901. He was appointed chairman of the Parliamentary Bills Committee on the death of Mr. Ernest Hart in 1898, and continued to hold that office till 1900, when he declined nomination for re-election. He frequently introduced depositions from the Committee to the Government in connexion with public health and medico-political matters.

Dr. Farquharson had considerable skill as a connoisseur. In his youth he had some notion of taking up art as a profession, but the genius of his brother, Mr. Joseph Farquharson, R.A., as he confesses, overshadowed him. For many years he contributed an article on the pictures in the Royal Academy, and his knowledge of art combined with his trained medical eye made him an effective critic. We also had the privilege of publishing many letters from his pen on subjects of current interest, written in a vigorous and happy style. He was the author of several contributions to *Blackwood's Magazine*, including a plea for Scottish landlords (1904) and the case of the moderate drinker. He solaced the tedium of his closing years by the production of two volumes of reminiscences, *In and Out of Parliament*, published in 1911, and *The House of Commons from Within, and other Memories*, which appeared the following year. Though somewhat carelessly written, these books give an interesting sketch of a varied life and many portraits of the men of mark with whom he was brought into contact.

Dr. Farquharson was unmarried. He was a J.P. and Deputy Lieutenant for the county of Aberdeen. In 1883 the honorary degree of LL.D. was conferred on him by the University of Aberdeen.

DR. ARCHIBALD S. DICK, of 1, Bellahouston Terrace, Ibrox, Glasgow, died in his 47th year in a nursing home, on May 26th, from acute pneumonia. He was a graduate of Glasgow University, taking the degrees of M.B., C.M., with "high commendation," in 1894, and M.D. in 1899. After graduation he spent several years as resident physician in hospitals in London, Dublin, and Glasgow. Dr. Dick was a most popular figure at college, in the hospital, and with his many patients. At the annual gathering of his college year the want of his genial humour and his kindly voice will be an irreparable loss. His personality endeared him to all who came in contact with him, but those who knew him best will miss him most. He led a strenuous life, ungrudgingly attending to the numerous calls of his large practice. Not possessing an over-robust constitution his early death may be placed to the stress of these days. The earth has lost one of its grains of salt, but those who were privileged to look into his heroic

soul know well that he would not look upon his death as a disaster but as a well-earned promotion. The sympathy of many mourners goes out to his widow.

THE LATE DR. HEBB.

SIR BRYAN DONKIN writes: May I add a few words from my personal knowledge to the memorial article in your issue of May 25th on the occasion of the death of my great friend and sometime colleague, Dr. R. Grainger Hebb? I most cordially agree with your statement that

No member of the staff of the Westminster Hospital in the last thirty years exercised so great an influence over the students or was so universally esteemed for the precision of his knowledge, for his entire freedom from professional cant, and for his essential probity of character; to none did old students return in after years with more affectionate and grateful remembrances.

These telling words are indeed a splendid tribute to his memory, true to the letter, and a eulogy that but few can deserve. But I am anxious to emphasize the fact that, whether or no his systematic lectures on medicine or his clinical teaching beyond the mere elements of medicine were more or less unattractive to some students, Dr. Hebb never lost touch of the principle that clinical study and pathology should be regarded as inseparable. If, indeed, his long association with the pathological department and his extensive acquaintance with all-round pathology, so widely known to the profession in London, may have overshadowed his reputation as a clinical observer and an exceptionally thoughtful and able physician, I am sure that he may be ranked with the very best of those comparatively few physicians who have persistently obeyed this principle. Hebb was in this particular fully worthy to be classed with such men as Wilks, H. Gawen Sutton, of the London Hospital, and James Andrew of Bartholomew's. In my opinion his clinical intuition was unsurpassed by anyone's in my time. He was as good at the bedside as in the *post-mortem* room.

Nor do I think that Hebb lacked the scientific imagination. Rather he held it in check, partly from his great reluctance to write on any subject prematurely, and partly because he ever realized the frequent errors made by some who, having formed plausible and attractive hypotheses, proceeded all too soon to regard them, and induce others to regard them, as fully verified theories. His retiring disposition, and his long-standing illness, may have deprived him of the title "a great physician" in the usual sense of these words, but a great physician he certainly was.

In the brief obituary notice of the late Colonel James Forbes Beattie, R.A.M.C.(ret.), p. 633, it should have been stated that he was promoted Brevet Colonel for valuable services rendered in connexion with the war, with effect from June 3rd, 1917.

The Services.

INDIAN MEDICAL SERVICE.

THE *London Gazette* of June 11th announces the following alteration in the rank and titles of surgeon-generals of the Indian Medical Service: Surgeon-generals ranking as lieutenant-generals shall be granted the rank and title of lieutenant-general, and surgeon-generals ranking as major-generals shall be granted the rank and title of major-general.

Universities and Colleges.

UNIVERSITY OF CAMBRIDGE.

At a congregation held on June 7th the following were admitted to medical degrees by proxy:

B.C.—W. N. Leak, A. W. Stott.

UNIVERSITY OF LONDON.

THE degree of D.Sc. in Statistics has been conferred upon Robert John Ewart, an internal student of the Lister Institute of Preventive Medicine, for a thesis on the influence of age of parent at birth on length of life, sex, susceptibility to zymotic diseases, stature, intelligence, and eye colour.

Dr. Janet E. Lane-Claydon has been appointed examiner in hygiene on the Board of Examiners for the academic diploma in sociology.

The Senate has expressed its gratification that the London Hospital has decided to open its medical college to women students.

The following were appointed staff examiners for medical degrees for 1918-19:—

Anatomy: Professors R. W. Reid and A. Macphail. Bacteriology: Professor R. T. Hewlett. Chemistry: P. Haas and Professor J. M. Thomson. Forensic Medicine and Hygiene: F. J. Smith and Professor Matthew Hay. General Biology: J. Stuart Thomson and J. T. Cunningham. Medicine: Professor Arthur J. Hall and Sir James Galloway, K.B.E., C.B. (Internal). Mental Diseases and Psychology: Robert H. Cole and W. H. B. Stoddart. Obstetric Medicine: G. F. Blacker and Comyns Berkeley. Pathology: Professor J. Martin Beattie and Charles Bolton, F.R.S. Pharmacology: Professor H. J. Campbell and Fred Ransom. Physics: W. Makower and F. Lloyd Hopwood. Physiology: Professor D. Noel Paton, F.R.S., and Professor E. H. Starling, C.M.G., F.R.S. State Medicine: Richard King Brown and W. G. Savage. Surgery: William Turner (Internal) and V. Warren Low, C.B. Tropical Medicine: C. W. Daniels.

The annual report of the Superintendent of the Brown Institution for 1917 states that 2,550 animals had been brought to the institution; they included 1,060 dogs, 840 cats, and 470 horses. Five lectures on dysentery and allied conditions were delivered by Mr. F. W. Twort, the superintendent.

LONDON INTER-COLLEGIATE SCHOLARSHIPS BOARD.

FOURTEEN medical entrance scholarships and exhibitions, of an aggregate total value of about £1,200, tenable in the Faculty of Medical Sciences of University College and King's College, and in the Medical Schools of Westminster Hospital, King's College Hospital, University College Hospital, and the London (Royal Free Hospital) School of Medicine for Women, will be offered for competition on Tuesday, July 16th, 1918. Full particulars and entry forms may be obtained from the Secretary of the Board, Mr. S. C. Ranner, M.A., Medical School, King's College Hospital, Denmark Hill, S.E.5.

SOCIETY OF APOTHECARIES OF LONDON.

The following candidates have been approved in the subjects indicated:

SURGERY.—*G. H. FitzGerald, *H. E. Lewis, *H. M. Waller.
MEDICINE.—*J. Gorsky, *F. Lyth, *H. Lyth, *G. G. Rigby, *J. Stephen, *T. C. Stephen.
FORENSIC MEDICINE.—J. Gorsky, T. Mensa Annan, J. Stephen.
MIDWIFERY.—A. M. Berman, A. G. Curzon Miller, S. V. Goldhurst, T. Mensa Annan, H. H. Selim.

* Section I.

† Section II.

Medical News.

DR. E. H. TWEEDY (principal medical officer) has been appointed a member of the executive committee of the colony of Sierra Leone.

OWING to the present position of supplies, it has become necessary to reduce the jam ration in the civil general hospitals scale from 8 oz. to 4 oz.

MR. HENRY EDGAR WILLIAM HOFFMEISTER, M.A., M.B., B.C.(Cantab.), M.V.O., of East Cowes, has by deed poll changed his name to Edgar William Seymour.

MR. WALTER SCHRÖDER, Coroner for Central London, and Dr. F. J. Waldo, Coroner for the City of London and Southwark (a past president), have been elected president and honorary secretary respectively of the Coroners' Society.

AT the last meeting of the Society of Public Analysts Mr. A. Chaston Chapman reported that he had worked out a method for the manufacture of plant nucleic acid on a large scale, and that considerable quantities of the acid and its salts are now being manufactured in this country.

THE annual meeting of the British Science Guild will be held at the Mansion House, London, under the chairmanship of the Lord Mayor on Wednesday next, June 19th, at 4 p.m., when an address on education, science, and leadership will be given by Lord Sydenham. Cards of invitation can be obtained from the Secretary of the Guild, 199, Piccadilly, W.1.

A MASS meeting will take place on Monday, July 1st, at 3 p.m.; a national conference on maternal and infant welfare will be held on July 2nd and July 3rd, and an educational mothercraft exhibition will be open throughout Baby Week, July 1st to 6th, at the Central Hall, Westminster. The address of the Baby Week Council is 27A, Cavendish Square, London, W.1.

THE late Sir George Hare Philipson, whose gross estate has been sworn at £26,235, has by his will bequeathed £2,000 to the University of Durham College of Medicine, Newcastle-on-Tyne, for the foundation of two Philipson scholarships to be awarded to the undergraduate of the college obtaining the highest marks at the M.B. final examination.

MISS FRANCES IVENS, M.B., M.S.Lond., Médecin-Chef of the Scottish Women's Hospital at Royaumont, Villers Cotterets, successfully evacuated the hospital last week in the midst of severe enemy fire and several successive air

raids. Miss Ivens carried on till the last permissible moment, operating under these trying conditions; no one among staff or patients was injured. Miss Ivens has been in charge of Royaumont since the hospital was opened in November, 1914, and received the Legion of Honour in 1917.

The third annual meeting of the National Council for Combating Venereal Diseases will be held at Caxton Hall, Westminster, on Monday next at 5.30 p.m., when the chair will be taken by the president, Lord Sydenham. A discussion will take place on the place of legislation in the campaign against venereal diseases. Among those who are expected to take part in it are Mr. Hayes Fisher, M.P., Mrs. A. C. Gotto, and Mr. E. B. Turner.

LIEUT.-GENERAL SIR ARTHUR SLOGGETT was entertained on June 10th by some members of the British Red Cross Society and the Order of St. John on the occasion of his relinquishing the post of Chief Commissioner of the joint societies at the expiration of his term of office as Director-General of Medical Services with the British armies in France. Among those present were the Earl of Donoughmore, the Earl of Lucan, Viscount Knutsford, Viscount Chilston, and Lord Cheylesmore. The Duke of Connaught was prevented from being present owing to his absence at Aldershot on military duties.

Letters, Notes, and Answers.

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the BRITISH MEDICAL JOURNAL alone unless the contrary be stated.

CORRESPONDENTS who wish notice to be taken of their communications should authenticate them with their names—of course not necessarily for publication.

Authors desiring reprints of their articles published in the BRITISH MEDICAL JOURNAL are requested to communicate with the Office, 429, Strand, W.C.2, on receipt of proof.

The postal address of the BRITISH MEDICAL ASSOCIATION and BRITISH MEDICAL JOURNAL is 429, Strand, London, W.C.2. The telegraphic addresses are:

1. EDITOR of the BRITISH MEDICAL JOURNAL, *Aitology*, Westrand, London; telephone, 2631, Gerrard.

2. FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisements, etc.), *Articulate*, Westrand, London; telephone, 2630, Gerrard.

3. MEDICAL SECRETARY, *Medisecra*, Westrand, London; telephone, 2634, Gerrard. The address of the Irish Office of the British Medical Association is 16, South Frederick Street, Dublin.

The address of the Central Medical War Committee for England and Wales is 429, Strand, London, W.C.2; that of the Reference Committee of the Royal Colleges in London is the Examination Hall, 8, Queen Square, Bloomsbury, W.C.1; and that of the Scottish Medical Service Emergency Committee is Royal College of Physicians, Edinburgh.

QUERIES AND ANSWERS.

INCOME TAX.

X. inquires as to his liability to pay tax on professional debts recovered since his retirement, and as to expenses incurred while acting in an "outdoor locumtenency."

*. The debts in question are not assessable to income tax; X. having paid tax on his assessed profits as a general practitioner is entitled to regard these sums as postponed receipts of profits taxed in previous years. On the other hand, he is liable to pay tax on his receipts as a locumtenent without any deduction for private expenses, notwithstanding that he is maintaining his former residence as well as paying for rooms, etc., where his work is now being done. A locumtenent on "indoor" terms is in a favourable position in that he receives (in effect) unassessable emoluments or benefits.

SALIVARY CALCULI.

G. P. desires advice as to treatment of a man aged 55, obese, and the subject of gout, who has salivary calculi. Several have been removed already from Wharton's duct, but after a period of days or weeks fresh ones make their appearance and cause considerable pain and irritation.

LETTERS, NOTES, ETC.

WRITING with regard to the difficulty of separating the parts of an all-glass hypodermic syringe which have become stuck, Dr. G. G. Davidson states that after leaving such a syringe, in which both the nozzle and piston were stuck, in strong nitric acid for three and a half months they came apart quite easily.

MR. W. J. GOODING (61, Burlington Road, New Malden) has patented a bedstead lift trolley to enable bedsteads without castor wheels to be transferred from one place to another. The trolley is wheeled beneath the bedstead, which by means of a lever is lifted a few inches clear of the ground.

THE TREATMENT OF PERNICIOUS ANAEMIA.

DR. THORNE THORNE'S note in the JOURNAL of June 8th, p. 645, has led a correspondent, "Locum," to send the following note: Nearly three years ago I took over a practice of a young friend who was joining the R.A.M.C., and one of the cases was a man with pernicious anaemia, as diagnosed by a professor of medicine. As the man was exceedingly ill and did not look as though he could last long, I gave him several doses of salvarsan cream (made by Allen and Hanbury) in the buttock, and he began to improve thereafter. The injections gave him considerable pain, and he refused to have as many as I had wished to give him; but he is alive and well to-day and going about superintending his work. He had been taking iron and arsenic before that, and I did not stop them, but a marked change came over him at that time. He is still taking the drugs at intervals, but possibly they may be unnecessary. I was afraid to stop them as he was doing so well.

ELECTRO-CHEMICAL TREATMENT OF GONORRHOEA.

CAPTAIN H. H. KING, I.M.S., writes with reference to the electro-chemical treatment of gonorrhoea to make the following suggestions:

1. That the same electrical treatment might possibly be of the greatest service in the treatment of ordinary infected gunshot wounds, helping the removal of bacteria and pus from the surface of infected tissues. I am not aware of this method having been tried.

2. That in the simple irrigation of all mucous membranes hypertonic salines should be more used, with or without the addition of compatible antiseptics such as potassium permanganate. I have used such with a little permanganate as large enemata in the treatment of dysentery. Knowles and Cole (*Ind. Journal of Med. Research*, January, 1917) have found enemata of 1 in 80 magnesium sulphate useful in amoebic dysentery. I see no reason why the ordinary weak permanganate solution used for the urethra should not be a hypertonic one.

3. For the irrigation and distension of the urethra a metal catheter might be used with a projection at the handle end for the entrance of the irrigating liquid, and with several small perforations in three rows along $\frac{1}{2}$ in. of its length starting from $\frac{1}{2}$ in. below the ordinary hole at the bladder end. The whole catheter should be traversed by another finer tube opening at the two ends of the catheter only, thus shutting off the bladder from the main channel of the catheter. Liquid would enter by the side nozzle, flow along the main channel, enter the urethra in its prostatic part through the small perforations, course along the urethra, and so out. The inner channel would drain the bladder of all leakage into it. Distension would be secured at will by squeezing the urethra. The catheter would be passed slowly, and stopped as soon as urine flowed from the inner tube.

I have no experience with such an instrument; the idea suggested itself on reading Captain Lumb's note (BRITISH MEDICAL JOURNAL, October 6th, 1917).

THE BELGIAN DOCTORS' AND PHARMACISTS' RELIEF FUND.

Subscriptions to the Second Appeal.

The following subscriptions and donations to the Fund have been received during the week ending June 8th:

	£ s. d.		£ s. d.
Dr. T. Rouse ...	1 1 0	*Anonymous ...	1 1 0
*Mr. J. H. Jacobs...	10 10 0	Mr. E. Spencer Evans (m.)	0 10 0
Dr. H. J. Mackenzie ...	1 1 0	Dr. Albert Lucas ...	2 2 0
Drs. Forsyth and Norman	1 1 0	Dr. Alfred Cox (m.)	1 1 0
Sir A. Pearce Gould (m.)	5 0 0	*Lady Cooper ...	10 0 0
Dr. W. A. Milne ...	3 0 0	*Mr. G. S. Albright	50 0 0

* Per Sir Rickman Godlee, m., Monthly.

Subscriptions to the Fund should be sent to the Treasurer, Dr. H. A. Des Voeux, at 14, Buckingham Gate, London, S.W.1, and should be made payable to the Belgian Doctors' and Pharmacists' Relief Fund, crossed Lloyds Bank, Limited.

THE appointments of certifying factory surgeons in the following places are vacant: Cruden (Aberdeen), Dublin (Dublin), Mullingar (Westmeath).

SCALE OF CHARGES FOR ADVERTISEMENTS IN THE BRITISH MEDICAL JOURNAL.

	£ s. d.
Seven lines and under ...	0 6 0
Each additional line ...	0 0 9
Whole single column ...	4 0 0
Whole page ...	12 0 0

An average line contains six words.

All remittances by Post Office Orders must be made payable to the British Medical Association at the General Post Office, London. No responsibility will be accepted for any such remittance not so safeguarded.

Advertisements should be delivered, addressed to the Manager, 429, Strand, London, not later than the first post on Wednesday morning preceding publication, and, if not paid for at the time, should be accompanied by a reference.

NOTE.—It is against the rules of the Post Office to receive *poste restante* letters addressed either in initials or numbers.

An Address

ON

THE SIGNIFICANCE OF CARDIAC MURMURS.

READ AT THE ANNUAL MEETING OF THE KENT BRANCH,
HELD AT TONBRIDGE, JUNE, 1918.

BY

CLAUDE WILSON, M.D. EDIN.,

TONBRIDGE WELLS.

GENTLEMEN,—Four years ago you elected me to the presidency of your Branch. I expected to hold the position for one year, and I read an address on irregular action of the heart. Since then has come the Great War, and, as a minor consequence, I still hold the post to which you elected me, another being that during this period no general meetings have been held within the area of the Branch. The President of the Association has recently issued an appeal for the revival of clinical and scientific work in the Branches and Divisions, and I have thought that a paper on a sister subject which recent work has for the moment placed in a somewhat confused position might be of interest and of use.

Since the war cardiac murmurs have become rather generally suspect. Not very long ago any murmur, with the solitary exception of the pulmonary systolic, was regarded as a sign of serious trouble, either temporary or permanent, and the insurance offices still look askance at murmurs of all kinds. But a reaction has arrived, and there are, among those who have followed superficially the trend of recent research, men who are inclined to go to the other extreme and say generally that a murmur does not matter. The truth lies between these two extremes. Some murmurs do not matter, others do, and, in forming an estimate of their import, we should in the first place endeavour to differentiate between the varieties, and, in the second place, realize that in any case a murmur is only one sign, and must be read in conjunction with other signs and symptoms of cardiac efficiency or the reverse.

Here I may enunciate an aphorism, the result of recent work, which is already very widely held, and which I venture to predict will become universally accepted. It may be stated thus: "On no solitary sign shall any heart be condemned." There are those among the elders who may say that they have always held this view. But such are either very few or they deceive themselves, for there is no shadow of doubt that upon the presence of a systolic murmur, and especially a well-marked systolic mitral murmur, and in the absence of any other sign or symptom pointing to cardiac inefficiency, countless individuals have been refused or heavily weighted when applying for life assurance; have been cut off from participating in healthy sports and exercises; have gone through life under a sense of incapacity and often in the apprehension of a special liability to sudden death, and have perhaps suffered the apprehension of the condemned cell when an operation became imperative, because some doctor had told them, on this or equally slender grounds, that they must never take an anaesthetic.

Very early in my career I was confronted with a case which caused me to revise my outlook on murmurs. The patient was a young lady who exhibited the most remarkable murmur I have ever listened to. It was very loud—systolic—and heard equally all over the heart. It was also heard all over both lungs, in the carotids, in the abdominal aorta, and with diminishing intensity in both femoral arteries. The murmur had been discovered a few years previously by a general practitioner, and the advice of a specialist had been sought, with the result that the patient, at about 20 years of age, was told she must live on one floor, and must not walk uphill. Before that she had run about and danced. I was a young man, but I had had a fair experience of cardiac disease, as resident physician in a large hospital, and I began with caution to test the efficiency of this patient's heart. I made her swing her arms about, go up and down half a dozen stairs, and then more; and I found that, as her exercises increased, the pulse improved rather than the reverse, that no dyspnoea nor pain was caused, and that no cyanosis, oedema, nor albuminuria developed. I took her to see the late Sir William Broadbent, and stated my reasons for

believing that the heart was practically sound, though I could not account for the murmur. He acquiesced, and suggested an ingenious explanation of the murmur—a minute congenital patency of the ductus arteriosus, leaving a negligible communication between the aorta and the pulmonary artery. Anyway the result was that the lady was restored to a life of useful activity, and that she lived for about twenty-five years more without any signs of cardiac failure, and died of pneumonia a few years ago.

This case made a profound impression on my mind. I argued that if so remarkable a murmur might exist in a heart which, for the practical purposes of life, was healthy, there were probably many murmurs which might be ignored; and I gradually came to the conclusion that a heart which could play football or go up Monte Rosa could not have anything very serious the matter with it. The argument I found applied equally to irregularities of the pulse; though, until the work of Mackenzie and Lewis enabled us to differentiate between the varieties of arrhythmia and to understand their varying significance, I had not the confidence I now possess regarding irregularity of action.

Functional and Physiological Murmurs.

In the case already cited, the murmur, whatever may have been the actual cause, was undoubtedly organic in origin. It illustrates a type which is extremely rare. To-day I have examined a case of a very different kind, but having this point in common: a systolic murmur which may not only with safety, but with great advantage to the patient, be ignored.

A young lady, working as a V.A.D. nurse, got tired, thin and easily fatigued, but showed no symptom referable to the heart. I saw her in bed, and found the first sound in the mitral area inaudible, and replaced by a blowing murmur which was conducted to the axilla. On sitting up in bed the same phenomena were observed; but, on standing up, the murmur completely disappeared, and the sounds became normal. On lying down again, the first sound disappeared and the murmur returned.

To what was this murmur due? We do not know. We may conjecture; but people never die from such conditions, and if they die and an autopsy is performed, the heart is found to be quite normal. "Functional" would be the term most commonly applied; but "functional" implies some derangement of function, and in these cases, where a systolic murmur is present in one position and not in another—a common type—there is, as a rule, no derangement of function, and Mackenzie prefers to call these murmurs "physiological." Under this heading, too, come the numerous systolic murmurs which are present one day and gone the next; and also many systolic murmurs which are constant and do not vary with position. It is not uncommon to find a very definite murmur which at the apex accompanies but does not replace the first sound, while at the base it is still more emphasized, and may render the first sound in both aortic and pulmonary areas inaudible.

Another murmur, rarer, is that which follows a normal first sound but stops abruptly with the second. Similar murmurs may be caused by valvular lesions; but if there is no history of rheumatic fever, and the heart responds normally to effort, the chances are that the murmur is not organic in its origin. But, even if it were, the valvular lesion which produces a systolic murmur and yet leaves a heart with good response to effort, and capable of riding a bicycle uphill, or other strenuous exercise, is probably trifling, and in such a heart the musculature is pretty certain to be healthy. Again, many of these murmurs are observed in children and adolescents, and in such there is a ready means of satisfying oneself that the heart is really sound. Sinus arrhythmia is common in the young, and can generally be readily induced. Make the patient take long, slow breaths pausing at the end of inspiration and of expiration. During inspiration the pace of the heart-beat will become accelerated, while during the later part of expiration, and during the pause before inspiration, the beats become very obviously slower and perhaps irregular. If this sign is present, the heart may very safely be pronounced sound. The following case is very similar to the last cited:

Some five or six years ago I saw a boy, aged 12, for some trifling ailment, and found he had a well-marked mitral murmur in bed, but that when he stood up it completely

disappeared. I took the view that the thing was of no importance and let him play football and cricket, and no harm resulted. Recently, for the purposes of this paper, I went to see him. He is 17½, well grown, and is working at wireless telegraphy. I examined the heart and found precisely the same condition present. Sinus arrhythmia was easily evoked, and this confirms the opinion I formed before I was aware of the significance of this condition.

Among the cautious commentators on this modern disregard of systolic murmurs in the young are those who hold that this optimism is not justified. They have noted and watched cases which later on develop serious heart disease. Of course these patients are not more immune than are those with obviously healthy hearts, any more than adolescents with postural albuminuria are immune from the possibility of nephritis at a later period. But my own experience is that heart disease and kidney disease do not result from these conditions; and, while I cannot recall a case which supports the contrary contention, I can cite many cases which I have had the opportunity of following for years, and which point to the conclusion that there is no danger in allowing patients presenting these anomalies to undertake any forms of exercise they may be inclined to and can perform without producing distress which is either severe or enduring. The general health, and with it the heart's efficiency, suffers if such patients are restricted. If there is anything the matter which matters, it will soon reveal itself; and we shall do infinitely more good than harm by reassuring all such patients as to the soundness of their hearts and encouraging them to do what they incline and feel equal to and by discouraging them from dwelling upon their health.

The next case presents somewhat different features:

This is a boy I have watched for many years. His father had died suddenly from heart failure, and the element of heredity—an element which in these conditions is, in my opinion, quite negligible—had been impressed upon the mother, and had also, in conjunction with certain physiological peculiarities, caused various doctors and "specialists" to regard the child's heart as one requiring the utmost care and many restrictions. When I first knew him as a child of 7 or 8 he was a miserable specimen, and pining under the continual solicitous observation of his mother and a devoted nursery governess. I shortly sent him to a mixed day school for little children and he did well. Later he went as a day boy, and ultimately as a boarder, to a boys' preparatory school. I let him ride a bicycle and play the usual school games, and sanctioned his being entered for a public school, in spite of the fact that a systolic murmur was occasionally present, that the heart could be seen beating over a wide area, and that, though the impulse could not be felt lower than the fifth space, it was readily detectable opposite the nipple in the anterior axillary line—a condition which, with perhaps a sixth space apex beat, is not necessarily pathological. This child has gradually grown into a fine healthy specimen of boyhood. I had arrived at my conclusions somewhat cautiously, and had gradually trained the heart and general physique from a state of weakness to a normal state of strength. Sinus arrhythmia is now easily evoked, as was doubtless the case when first I saw him, though it was not noted at that time because I was then unaware of its significance, and did not—as I now do—look for it in any youthful case I am asked to examine. Two years ago, when he was 12½ years old, he went with his mother to Cornwall for the summer holidays. There he developed a cough, and his mother took him to a doctor, who, after carefully examining him, pronounced his lungs healthy, but said, "I suppose you know about his heart?" The mother had all her old fears revived, but told him that her own doctor at home had watched the boy carefully for years and pronounced his heart sound; had permitted games and bicycling, and sanctioned a public school. The Cornwall doctor said that, were he his own child, he would on no account permit any of these things. He prohibited all exercise for the time, but wisely advised the mother, when occasion offered, to seek Sir James Mackenzie's opinion. On her return home she came to me in a terrible state of agitation, and we shortly all went together to see Sir James, who, I am glad to say, confirmed my opinion in all respects. The boy has now been for two or three terms at a public school, and he comes to see me during each vacation. He is a bright, happy boy, healthy in mind and body, and joins in the studies and sports of the school without restriction, no more attention being paid to his health than to that of the other boys.

I could multiply these cases and cite similar ones in adults where a general test of cardiac response to effort will usually lead to a right conclusion, though we seldom, after 20 years of age, have the help that is given if long slow breaths produce their physiological and characteristic effect upon the pace of the heart-beat.

Of the cases hitherto recorded, the first was an example of negligible congenital defect and the rest were physio-

logical anomalies. The following is a case of quite a different kind:

A young lady, aged about 20, had a sharp attack of influenza. It left her enfeebled and with a mitral systolic murmur. On getting about she panted a good deal on going up gentle inclines. But I let her walk in the garden and roads near by in preference to keeping her in bed. A little later on she and her sister went to Switzerland, and I was not surprised to hear that she was taking walks and enjoying them. But I was surprised, when they returned home, to find that they had become Alpine climbers and had been up the Jungfrau and the Schreckhorn. I found the heart normal and the murmur had disappeared. This occurred twelve years ago and the patient has kept well ever since.

The case is an example of what Mackenzie calls the poisoned heart—the heart affected by toxæmia, a thing that may happen during any systemic infection. Such patients get well much sooner under good hygienic conditions than if they are kept for long in bed, as they often are. The difficulty lies in excluding organic disease, which may occur under similar conditions, but which far more commonly develops during an attack of rheumatic fever than in other acute febrile infections. A rough murmur is more likely to be organic, while a soft one is more probably due to a slight dilatation which, provided the myocardium is intrinsically sound, is set right pretty quickly if the patient gets about and gradually increases exercise as it is comfortably tolerated. The condition corresponds to the temporary weakening of the skeletal muscles from similar causes. I can well remember in my own case, when convalescing from measles, that on first going out I was obliged to sit down after walking a couple of hundred yards. Within a week I could do a five-mile walk, taking the hills as they came. This rapid recovery of muscular tone would have been delayed had I remained longer in bed, and the same is true of the heart muscle, poisoned but not damaged during fever.

Systolic Murmurs Resulting from Endocarditis.

These are more serious because they are apt to be permanent, to become associated with other murmurs which are not systolic, to be accompanied by vegetations, and because both in pericarditis and endocarditis the myocardium is very likely to be invaded, and the heart muscle damaged, perhaps permanently. It is not always possible at first to say whether a murmur is due to dilatation or to endocarditis, and a poisoned heart may give rise to signs of muscle weakness similar to those of early inflammatory invasions. But severe cases are generally obvious and the slighter can usually be diagnosed as time goes on. Organic disease may be assumed as the rule when cardiac signs and symptoms develop in the course of rheumatic fever. And when organic disease is obvious, or suspected on adequate grounds, caution during convalescence is clearly indicated. Later on diastolic murmurs may develop, or the missed beats of partial heart-block may be noted in the cases which go badly. On the other hand, if recovery of myocardial tone takes place, gradual but cautiously graduated exercise may be permitted in spite of any murmurs which may remain. The muscle will not regain its maximum potential of health and energy unless it is given the chance, and in the later stages of convalescence, whatever be the damage remaining, exercise that is easily borne, and which increases the patient's sense of well-being, may be safely permitted.

Auricular Fibrillation.

The effect upon the pulse will naturally be watched, and any undue acceleration will inculcate caution; while, if exertion habitually produces a noticeable irregularity, we are probably confronted with auricular fibrillation. This must be distinguished from irregularity which becomes emphasized as the heart slows down after exercise, and which may be due to one of three causes: (1) Sinus irregularity, which we look for in the young and which is of excellent augury; (2) extra-systoles, easily detected, and, apart from other signs and symptoms, fairly negligible; and (3) (much more rarely) the minor phases of heart-block—a condition which should never be out of our minds when dealing with hearts damaged during the course of acute fevers, and especially acute rheumatism. Missed pulse beats are generally due to extra-systoles, and the cardiac sounds which accompany them are usually characteristic. Missed pulse beats synchronizing with

missed heart-beats suggest heart-block, though they may be due to extra-systoles too faint to be audible.

The most important point to recognize regarding systolic murmurs developed during febrile attacks is that the condition of the heart muscle is the all-important factor. In one of the most obviously and permanently damaged hearts that I have seen, following acute rheumatism, there never was any murmur at all, but there were (and still are, fifteen years later) obvious signs of cardiac embarrassment on any attempt at really active exercise. Had this lad shown a systolic murmur his symptoms might have been attributed to a valvular lesion, whereas the inefficiency exists without it, and is due to myocardial disease.

Such cases are, of course, not uncommon. I have recently seen an elderly lady whose early history I have been unable to unravel. She has general cyanosis, clubbed fingers, breathlessness on exertion, and oedema of both legs, and she has often been "doctored for her heart." But the pulse when I saw her was regular and not very fast, the heart not obviously enlarged, and the sounds quite normal. The exact diagnosis admits of more than one hypothesis, but that there are degenerative changes in the cardiac muscle is obvious, and the addition of a systolic murmur would not materially affect the prognosis, which is certainly grave.

It would be easy to quote many cases of such cardiac entelebment in which a systolic murmur was the only audible sign, but in these cases there is always evidence of weakened muscle and often of auricular fibrillation. In this condition—and it is one in which the outlook is always menacing—a systolic murmur is very often the only audible anomaly, and I think there can be no doubt that it is this association, in conjunction with the accompanying gamut of serious signs and symptoms resulting from inaction of the auricles, which has given rise to the long-standing impression that this is the natural ending to mitral incompetence, and has invested the mitral systolic murmur with its halo of sinister augury. The signs and symptoms have been attributed to "back pressure," and we all know the classic chain of events which is supposed to be gradually and surely forged. But the familiar clinical syndrome is often found without any murmur at all, and is in reality due to the impairment of the cardiac mechanism as a whole consequent on disease of the muscular wall and on the failure of the auricles to contract; and, if there is any "back pressure" at all, it is a minor factor, and proceeds, apart from extreme narrowing of the mitral orifice, equally and simultaneously from both sides of the heart. In many such cases there was once a double murmur, and mitral stenosis was the really important valve lesion; but as with the onset of fibrillation the presystolic murmur necessarily disappears, the serious results have been wont to be attributed to the regurgitation of which evidence still remains.

In all cases of obvious cardiac embarrassment a general survey must be made, and one point which can generally be settled at once is whether auricular fibrillation is present or not. The point is so important, and is as yet so commonly misunderstood, that a short review of its most obvious signs may not be out of place, seeing that it is often associated with a systolic murmur. The pulse, which may be moderate or fast, presents an "absolute irregularity"—generally recognizable by the finger, or by the heart sounds, and always by the sphygmograph—in which no two consecutive beats are quite the same in time or volume, and the irregularity is increased by effort. This is sufficient to establish the presence of the rhythm, but corroborative evidence is often found by noting that the pulsation in the jugulars is simple and not undulating, and that it corresponds exactly with the ventricular contractions, to which it is directly due.

So much for systolic murmurs accompanying serious heart disease. The murmur does not indicate the real trouble, which may be associated with fibrillation, or with heart-block, or be due to degenerative changes without abnormal rhythm. But the common association need in no way bias our judgement as to the unimportance of systolic murmurs in the very numerous cases in which they are heard in hearts which show no evidence of inefficiency or other signs of structural impairment; and in all such cases a systolic murmur may be safely and wisely disregarded.

Murmurs which are not Systolic.

Here we are confronted with a difference between the physiological and clinical terminology. Clinically the systolic phase commences with the beginning of the first sound and ends with the beginning of the second. It coincides with the systole of the ventricles, and murmurs occurring during this period are always called systolic. But while the physiological systole commences with the contraction of the auricles, the murmurs caused by the auricular systole are clinically termed "pre-systolic."

As all the murmurs occurring during the diastole of the ventricles have a graver significance than that which attaches to systolic murmurs proper, it is convenient to group them under a common heading; and, provided we keep the above considerations in view, we may welcome Mackenzie's suggestion that they be grouped under the generic designation "diastolic."

The Three Chief Varieties of Diastolic Murmurs.

1. *The aortic diastolic murmur*, easily detected, replacing the second sound, generally accompanied by Corrigan's pulse, and due to aortic regurgitation.
2. *A murmur occurring early in the pause*, due to aspiration of blood from the auricle to the ventricle, found as a late sign of mitral stenosis and occurring alone in many cases of auricular fibrillation, with stenosis.
3. *The crescendo presystolic murmur* characteristic of mitral stenosis, running up to the first sound, or alternatively to a systolic murmur (double mitral), due to the systole of the auricle in conjunction with a narrowed outlet, and naturally disappearing when the systolic action of the auricle ceases with the onset of fibrillation.

It will be noted that, while systolic murmurs are often due to negligible or transient causes, the diastolic murmurs all indicate serious and hampering disease. Of this I shall have more to say, but may here state that, while aortic incompetence gives rise at once to a diastolic murmur and always implies the necessity of restricting effort to well within the limits of tolerance, the case of mitral stenosis is somewhat different; this condition comes on gradually after an attack of endocarditis, and it may be months or years before evidence arises on which to base a diagnosis. It at first results in only a very slight narrowing, and, while the process may become arrested at any stage, it may proceed till the orifice is represented by little more than a slit. But if a presystolic murmur is heard, a guarded prognosis must be given, and it may be stated generally that patients showing any one of the diastolic murmurs should be discouraged from running risks, and should always be protected from the strain of occupations which imply the necessity of strenuous effort.

Prognosis.

In the early part of my paper I cited several cases from the point of view of prognosis—cases which, in my judgement, were of good augury. I have also referred to cases, only too familiar to us all, of far more serious portent. I will now speak of two more patients, illustrating many of the points I have already alluded to, and taking up their history in retrospect, for both are elderly ladies, spare of body, and active in temperament, and both about 70 years of age. They are neighbours, and each of them is known to have had a systolic mitral murmur for thirty or forty years, and it may be more. Their condition is, however, very different.

The first has never had any cardiac symptoms at all. I examined her the other day, and found a rough systolic murmur heard all over the heart, quite replacing the first sound. The mitral area appears to be the point of maximum intensity, and the murmur is audible in the axilla and all over both lungs at the back. The apex is in the sixth space. Barring an occasional extra-systole there is no irregularity. She can mount stairs and walk up hills, and is exceptionally active for her age. How or when the murmur started no one knows. It may be a congenital affair, or it may have originated in endocarditis. But though no doubt there is an organic lesion (mitral incompetence) the murmur is obviously sound and the effect of the regurgitation is negligible so far as the calls of ordinary life are concerned. She is a good example to quote in favour of Graham Steele's dictum, recently unearthed by Mackenzie, that no one dies from mitral regurgitation, though at her age, with the degenerative period of life well advanced, the future can hardly be regarded with equanimity.

Her neighbour's condition is far otherwise. Her heart trouble began during an attack of rheumatic fever. She has had many attacks of heart failure, and at her best is easily made breathless and has to pause on an ordinary flight of stairs. But by taking small doses of digitalis two or three times a

week and keeping within her limits, she gets along fairly well. She has a softish blowing systolic mitral murmur; her heart beat is diffuse, the left ventricle slightly enlarged, and her pulse, which is always slightly irregular, becomes markedly so after very moderate exertion. What is the condition of her heart? Clearly, like the other case, there is mitral regurgitation; but that is not the main thing. Her heart muscle was doubtless invaded when the trouble first developed, and now her auricles are not acting at all. They are in a state of permanent diastolic dilatation, and their musculature is in a constant state of ineffectual fibrillary contraction (auricular fibrillation). I suspect that she, at one time, had in addition a presystolic murmur, that there is narrowing as well as incompetence of the mitral valve, and that the case is really one of mitral stenosis, accompanied by myocardial invasion and secondary degeneration.

These two cases form a very instructive contrast, and suggest certain reflections on the effect of valvular lesions in general.

Why should it be that systolic murmurs are often negligible, and diastolic murmurs not so? I cannot say that I have seen any convincing explanation, though I have been convinced as to the facts. And yet it seems to me that a consideration of the lesions which give rise to the murmurs, and of the effects which are likely to result on the cardiac mechanism and on the heart's nutrition, do afford an explanation. I do not now speak of the grave cases in which a systolic murmur has been known to exist for years, which terminate in progressive heart failure, and in which a widely dilated mitral orifice is found *post mortem*. As in the case of the clinical association of fibrillation with a systolic murmur, so it is with these. We have got so accustomed to the assumption that the whole of the disorganized *post-mortem* findings are the end results of mitral regurgitation, that it is not easy to reshuffle the conditions in our minds, and realize that the main factor lies in disease or degeneration of the heart wall, and that mitral incompetence on a large scale is a result, and only in the later stages a contributory factor to the eventual catastrophe.

Nor need I dwell, at the other end of the series, on the physiological and functional murmurs—always, by the way, systolic—which are so common, especially in the young. They are often associated with febrile and debilitated conditions, and these of course need care and treatment; but, where found in conjunction with a good cardiac response to effort, they are negligible, and the only difficulty lies in distinguishing them from murmurs due to organic causes. Fortunately this difficulty, which is sometimes a very real one, is of comparatively little importance if it can be shown that organic systolic murmurs, existing alone, and unaccompanied by other evidence of cardiac disease, depend on lesions which are in themselves not serious.

On the right side a tricuspid systolic murmur is known to be often physiological, and that the regurgitation is generally inconsiderable is clearly shown by the small size of the ventricular wave in the jugular tracing. It is probable that a similar state of things is common also at the mitral valve, while even a more considerable back-wave is not very serious in an otherwise healthy heart. In the cycle of events the left auricle contracts, and throws its blood into the ventricle, and then immediately dilates and begins to fill again from the large veins, which are not only full of blood ready to pour into it, but must also be actively aspirated by the intrathoracic pressure being lower than the atmospheric. When the ventricle contracts the blood will be driven in the direction of least resistance—into the open aorta—and any that regurgitates through the mitral valve is met by the contents of the auricle already rapidly filling. Unless the mitral dilatation is considerable, very little will get through, and even if it is considerable, the counteracting forces are far from negligible. The period, too, during which regurgitation is possible is limited to the duration of the ventricular systole, and there is no interference with the blood supply to the heart itself through the coronary arteries. This is, perhaps, the main point, for—as has been shown by Starling¹ and others—the reserve power of the heart is enormous, and depends essentially on an unrestricted blood supply to the myocardium. Certain it is, as we have seen, that such cases may go on for years without any interference with the ordinary calls of life.

The small importance attaching to aortic systolic murmurs is perhaps even easier to explain. Some of them are probably functional, as at the pulmonary orifice;

but, granted that a murmur is due to narrowing, it need have but little adverse effect. Stenosis is due to the adhesion of the margins of the cusps, and though a slight narrowing (extreme stenosis is very rare) may give rise to a loud murmur, it offers no serious barrier to the passage of the blood through the valve, and is easily compensated by a slight hypertrophy. If the process of adhesion continues, the margins of the cusps get shortened, and an aperture is left on closing, through which regurgitation takes place. So that, if there is much stenosis, we will also get incompetence, and we may be pretty sure that if there is no diastolic murmur the narrowing does not amount to very much; and further, unless there is incompetence, the circulation in the coronaries will not be interfered with.

I now turn to the diastolic murmurs, and hope to show that the lesions giving rise to them (mitral stenosis and aortic incompetence) produce effects which hamper the mechanical action of the heart, and also that interference with the circulation in the coronaries is, in both cases, a probable result. This latter factor is a most important one, for it must lead immediately to cardiac inefficiency and eventually to fatty or other degenerative changes. It is clear that any marked narrowing of the mitral opening must throw an extra strain on the auricle, which will hypertrophy to meet it; but if the narrowing proceeds and gets extreme, the auricular musculature at last gives way and fibrillation supervenes. But before this event, and apart from any inflammatory invasion of the myocardium, the nutrition of the heart wall is likely to have been impaired from inefficient blood supply. In stenosis that is more than very slight, the ventricle may fail to get adequately filled, the effect of which is seen in a general feebleness of the whole body, and, as the coronaries participate in the general failure of the circulation, the degenerative changes in the myocardium, which are the precursors of fibrillation, result.

In aortic regurgitation, the hampering effect on the machine is too evident to need dwelling upon. It is not, like mitral regurgitation, a process limited to the short period of the ventricular systole, but one which begins as soon as the systole terminates, and continues throughout the ventricular diastole, during the whole of which period the back-flow from the aorta into the ventricle, resulting from the systemic blood pressure in the aorta, is aided by the aspirating effect of the dilating ventricle. And further, as the force which normally fills the coronaries is derived from the high pressure in the aorta at the end of systole, and from the consequent back-kick which closes the aortic valves, it is obvious that in regurgitation there will be interference with this important function, and degenerative changes in the cardiac muscle are an almost certain consequence.

Having now reviewed the nature and significance of the commoner endocardial murmurs with which we are daily confronted, I come back to where I started, to remind you that our final judgement must always be based on a general consideration of each case as a whole, and in this estimate the presence or absence of definite signs of cardiac embarrassment, and a careful examination of the heart's response to effort, should always be given their due weight, and often a preponderating weight, in the formation of an opinion of the organ's capacity to meet the ordinary—and the extraordinary—strains of life.

The views I have expressed are those to which my own experience and reasoning have led me, and on which I have acted with increasing confidence for nearly thirty years. But I owe a debt of gratitude to Sir James Mackenzie both for personal encouragement and for his illuminating writings, which have both strengthened and clarified my opinions. Similar conclusions have been drawn by other workers, and it is satisfactory to find that the Medical Research Committee's "Report on soldiers returned as cases of D.A.H. or V.D.H."² after a very careful investigation, arrives at the view that systolic murmurs existing alone, and "without other disqualifying signs and symptoms," should be ignored. This has now come to be the modern teaching, and it has come to stay, though as yet many of the authorities have not accepted it, and the profession in general has hardly been able to divest itself of preconceived ideas. On the other hand, the subject is "in the air," and, as I stated early in my paper, the conclusion has been drawn by some that murmurs of all kinds may be discounted, and that consequently there is not much use in

spending time and trouble over them. Such is far from being the case, and the suggestion of the Medical Research Committee, that the issue, in estimating efficiency, is confused if the presence of a systolic murmur is noticed at all, does not appear to me to be a sound one. Every murmur is well worthy of attention, and those which can be classified as negligible should be noted as such. A knowledge of the nature and significance of the different types will lead to a reasoned conclusion as to how much weight should be attached to each. Diastolic murmurs have always a serious significance, and systolic murmurs are often associated with grave disease. But many systolic murmurs are negligible, and the general recognition of this truth will free a considerable section of the community from a needlessly restricted life, and from a cloud of unnecessary and haunting apprehension.

TRANSFUSION WITH PRESERVED RED BLOOD CELLS.

BY

OSWALD H. ROBERTSON, CAPT. M.O.R.C., U.S.A.,
U.S. ARMY BASE HOSPITAL.

THERE is a definite need in front area medical work of a method for giving transfusions rapidly. At casualty clearing stations during the busy time of an attack, it is obviously impossible to perform transfusions by the usual methods in nearly all the cases in which transfusion is indicated. The difficulty of procuring sufficient blood under rush conditions, the time consumed in carrying out the transfusions, and the need of every available medical officer in the operating theatre, all tend to reduce the number of transfusions which can be given. The use of preserved human blood cells for transfusion suggested itself as a possible solution of certain of these difficulties. A quantity of blood sufficient for a number of transfusions could be stored up beforehand and used as needed. The technique of transfusing such blood is simple and could be handled by one medical officer.

History of the Subject.

The experimental basis for this work was laid by Rous and Turner¹ working at the Rockefeller Institute for Medical Research. They found that blood taken into a solution of dextrose and sodium citrate and kept in the cold could be preserved for several weeks. Not only did the red blood cells thus treated remain intact, but they retained their viability for a long period. The preserving fluid used consisted of 5.4 per cent. dextrose combined with 3.8 per cent. sodium citrate; both of these solutions are isotonic with blood plasma. The optimum proportions of blood and dextrose citrate solution were found to be as follows: Three parts of blood, two parts of citrate, and five parts of dextrose solution. This mixture was placed in the ice chest and the red cells allowed to sediment. The supernatant fluid showed no signs of haemolysis even after the red cell layer had been stirred up repeatedly. Furthermore, after washing these cells in Locke's solution there was no evidence of loss of integrity. It was found that the rabbit's blood preserved in this way could be kept intact for three to four weeks, and sheep's blood for as long a period as eight weeks. Human red blood cells showed no apparent deterioration at the end of four weeks. They determined the viability of preserved blood cells by means of transfusion of these cells in bulk. Rabbits were used for this purpose. A normal rabbit was bled a large quantity, up to half its blood volume, causing a marked drop in the haemoglobin percentage and red cell count. Immediately afterwards the rabbit was transfused with an amount of preserved rabbit's blood cells equal to the amount lost in bleeding. The haemoglobin returned promptly to its previous level. The animal showed no ill effects from the procedure, and the haemoglobin and red cell count remained normal. This demonstrated that the transfused preserved blood cells were behaving as normal red corpuscles. By this means it was found that rabbit's blood could be kept living for two weeks. Many similar experiments were carried out with the same result. Parallel tests were made with blood cells kept for longer periods. Rabbits were bled a large quantity as before and immediately transfused with preserved blood cells kept three weeks or more, but which still showed no signs of haemolysis. There was a prompt return of the haemoglobin to normal after the transfusion. This condition, however, was only temporary. The red cell count and haemoglobin soon began to fall, and by the end of the second day the transfused cells had practically disappeared from the circulation, leaving the rabbits markedly anaemic. The animals seemed normal

otherwise—that is, there was no apparent harmful effect from the transfusion of intact preserved blood cells kept beyond the period of their viability. On the other hand, the transfusion of preserved blood cells that were beginning to show haemolysis had an extremely harmful effect, and the recipients died often within twenty-four hours. At the necropsy evidence of marked haemolysis was found.

An opportunity to test the usefulness of this method of transfusion with preserved human red blood cells was afforded me by the medical authorities of the Third Army, B.E.F., at whose casualty clearing stations the work was carried out.

METHODS.

1. PREPARATION OF THE PRESERVING SOLUTIONS.

The solutions of dextrose and sodium citrate are made up on the basis of 500 c.cm. of blood, as this is the usual amount taken from a donor. This requires in round numbers 350 c.cm. "isocitrate" (isotonic sodium citrate solution) and 850 c.cm. "isodextrose." These two solutions must be made up and must be autoclaved separately. Freshly distilled water should be used for all solutions.

For the preparation of "isodextrose" powdered dextrose is preferable, but since this substance is no longer obtainable in any quantity liquid glucose is used instead, and thus far has proved satisfactory; 2 grams of the liquid glucose is equivalent to 1.6 grams powdered dextrose. Thus, to make up 850 c.cm. of a 5.4 per cent. solution, 46 grams of powdered dextrose or 57.5 grams of liquid glucose is needed. On account of the difficulty in weighing out and dissolving liquid glucose, it is convenient to make up a large quantity of a 20 per cent. solution. This can be used as a stock from which the "isodextrose" may be prepared. Enough stock for six lots of "isodextrose" is made by dissolving 360 grams of liquid glucose in sufficient distilled water to bring the total volume of the solution to 1,800 c.cm. It is then filtered through coarse filter paper. If the solution is to be kept it should be sterilized. For making "isodextrose" 287 c.cm. of this concentrated solution is diluted with distilled water to 850 c.cm. in a clean two-litre bottle (Winchester). The bottle is stoppered with a cotton-wool plug, which is covered with gauze and tied on. The solution is sterilized in the autoclave for one half-hour at a temperature of 105° C. (equals 3 lb. steam pressure). This temperature should be reached slowly, as bottles of this size are liable to break if the change of temperature is rapid. For this purpose a one-burner Primus lamp is suitable. Care should be taken that the temperature does not exceed 105° C., as glucose may decompose if heated above this point.

There are no difficulties in preparing the 3.8 per cent. sodium citrate solution, but it is convenient to make up a 20 per cent. stock solution. A quantity sufficient for six lots of "isocitrate" is prepared by dissolving 90 grams sodium citrate in distilled water to a volume of 450 c.cm. and filtering. If this concentrated solution is to be kept it should be sterilized. For making "isocitrate" 66.5 c.cm. of the 20 per cent. solution is diluted to 350 c.cm. with distilled water. These 350 c.cm. amounts are sterilized in small bottles of the size used for transfusing the blood (described later). The same precaution is taken to cover the mouth of the bottle as in the case of the glucose solution; 105°–110° C. in the autoclave for one half-hour is sufficient.

2. PROCURING THE BLOOD.

(a) Donors.

Persons belonging to blood group IV² only are used. This saves the necessity of doing agglutination tests before transfusion, since blood cells of this group are not haemolyzed or agglutinated by the blood of any individual. The writer has not had the slightest difficulty in getting volunteers for donors. The importance of transfusion is explained to them beforehand and they are told that it is now possible to keep blood for some time and have it immediately available when needed. The donors are chosen from among patients with trivial wounds or those who have recovered from slight wounds. Persons giving a history of malaria, trench fever, or syphilis are excluded.

(b) Apparatus.

The apparatus for bleeding and the method of measuring are shown in Fig. 1.

The Winchester bottle containing the sterile isodextrose serves as the bleeding bottle. Before mixing the solutions

a mark is made on the bottle at the upper level of the dextrose solution, A; 350 c.cm. isocitrate is then poured in and another mark made at the new fluid level, B. The distance A-B measures 350 c.cm., which is roughly two-thirds of 500 c.cm. A third mark is made at C, a distance

FIG. 1.

above B equalling one and a half times the distance A-B. This measures approximately 500 c.cm.

The chief points about the apparatus are these:

The needle (A) should be of a large bore—1.5 mm. diameter was found to work well—and not more than 1.5 in. long. It should have a fairly large olive-shaped base. The needle is the most important part of the apparatus, and requires careful attention. Before each bleeding it should be carefully sharpened. The most important consideration in the sharpening is to produce a good spear point. If the point is well protected when not in use by a metal barrel or piece of rubber tubing, sharpening will require only a moment or so. The needle must be kept scrupulously clean, and after each bleeding should be washed out at once, all fragments of fibrin or clot removed from the base, and small pieces of cotton-wool soaked in liquid paraffin thrust through the lumen with the stilette. The whole needle is well oiled before being put away.

The rubber connexion (B) should be flexible, and not more than 3 in. long. The inner surface should be smooth, and the lumen slightly smaller than that of the glass inlet tube (C). If the rubber connexion fits snugly over the base of the needle, tying it on is not necessary.

The glass inlet tube (C) is made of a large-bore glass tubing about 6 mm. internal diameter. It should extend below the level (B) of the solution in the bottle.

The glass tubing and the stopper are dry sterilized. The needle and attached rubber connexion are boiled for ten to fifteen minutes before use.

(c) Procedure of Bleeding.

The donor's arm is extended at a right angle to the body. The skin of the antecubital space is scrubbed with soap and water and the sterilization completed with alcohol. A tourniquet is applied to the arm high up and a suitable vein chosen, remembering that the needle is to be inserted towards the hand. It is very important to have as large a vein as possible. Opening and closing the fist and flicking the skin below the point chosen for venipuncture aids much in dilating the veins. At the point selected to puncture, a small amount of novocain is injected intracutaneously. The tourniquet is then released. The apparatus is assembled as shown in the diagram, great care being taken to keep all the open parts sterile. Sufficient pressure is made with the pump to fill the system with solution. When the air has been driven out of the needle, the stopcock on the connecting tube is closed. The pump-bulb is reversed so that suction can be made when needed. The apparatus is now ready for use.

The tourniquet is again tightened sufficiently to make the veins stand out well, but not enough to obliterate the pulse. The cuff of a blood pressure apparatus makes an excellent tourniquet with a pressure kept at 50–60 mm. A small nick is then made through the skin with the point of a scalpel. The bottle is placed on a stand close to the patient's arm in such a position that there will be no kinking of the rubber connexion when the needle is in the vein. Slight suction is next made in the bottle. The

skin opening is mopped dry with a piece of sterile gauze and the needle inserted for a short distance beneath the skin before entering the vein. The stopcock is then opened and the needle is pushed into the vein immediately. The blood follows the column of solution down the tube without leaving an air space. A moderate degree of suction is maintained and the donor continues to open and close his hand slowly, care being taken that he does not move his arm. It is essential to keep the needle immobile. The operator should hold it throughout the bleeding, steadying his hand against the donor's arm. With these precautions 500 c.cm. of blood can be easily and quickly obtained.

If clotting occurs for any reason, such as the needle slipping out of the vein or air leakage, and the blood ceases to flow, the tourniquet should be released, the stopcock closed, the needle withdrawn from the vein, and another attempt made with a fresh apparatus (needle, rubber connexion, and glass tube) using the same receiving bottle. It is usually better to take another vein.

It is not necessary to agitate the bottle until after the bleeding. When the 500 c.cm. mark has been reached the tourniquet is removed, the stopcock closed, and the needle withdrawn. The bottle is then given a gentle rotary motion in order to mix the blood thoroughly with the preserving solution. After this the rubber stopper is removed and the original cotton plug, which has been kept sterile, is replaced. The blood is labelled with date, quantity, and name of donor, and placed in the ice-chest to sediment.

If the donor's veins are small and the needle method fails, the vein can be cut down upon and a cannula used. Inserting a cannula into a vein is more difficult and time-consuming than the needle method, and offers greater possibility for infection.

The glass tubing, rubber connexion, and needle are cleaned thoroughly immediately after the bleeding. The donor is kept on the table for fifteen to twenty minutes in order to avoid the feeling of faintness which may be caused by getting up at once. The withdrawal of this amount of blood—500 c.cm.—has no harmful effect.

In order to give transfusions of varying amounts it has been found convenient to procure quantities of 250 c.cm. of blood as well. For this purpose quart bottles are used in place of the Winchester, and contain half quantities of the glucose-citrate solutions. It is best to bleed 250 c.cm. from each arm, using a fresh suction apparatus for the second bleeding.

3. STORING THE BLOOD.

An ice-box is necessary for storing the blood. A suitable one can be improvised. The box, made of wood, should be double-walled with an air-space between. Two packing cases fitting one inside the other serve the purpose well. The space between the two boxes is filled with sawdust or some such non-conducting material. A tight fitting door or lid is necessary. It is well to line the inside box with tin, and one end of this space should be fenced off to contain the ice.

This large bulk of blood, 500 c.cm., settles rather slowly. The supernatant fluid increases at the rate of 150 to 200 c.cm. a day. This is one real objection to the method, since it means that the blood is not available for immediate use. However, at the end of four to five days the blood will have settled to about 800 or 900 c.cm., and can then be used, as this amount of cell suspension does not contain any more sodium citrate than is given in an ordinary citrate transfusion. The additional fluid and sugar solution is an advantage rather than otherwise. Smaller quantities of blood, 300 and 400 c.cm., when taken into the same amount of preserving fluid that is used for 500 c.cm. of blood, settle more quickly, and could be used at the end of three or four days. If there is an indication that blood will be needed soon, 300 c.cm. amounts may be collected in place of the usual 500 c.cm., and the sediment of two or more bottles combined for a transfusion.

The supernatant fluid seen through the green thick-walled bottle has a slightly opaque bluish-white appearance. This opacity is due chiefly to blood platelets in suspension. Sometimes it has a yellowish or yellowish-green appearance if the blood plasma is highly coloured. Occasionally a scum of fat collects at the surface. This is of no significance. A pink tinting of the supernatant fluid

should be regarded with suspicion as it signifies haemolysis probably due to infection. Such a blood should be discarded. This has not occurred in the present work thus far, but has been seen experimentally. Cultures of the supernatant fluids have all been negative. Occasionally the supernatant fluid shows a pink tint during the first two or three days of sedimentation, which gradually disappears. This is not haemolysis. It is due to unequal settling of the red cells. A thin suspension of cells remains above the main bulk of the blood and sediments more slowly. Beginning disintegration of the red cells may occur at the end of the fourth week of keeping, and is marked by a pink colouring of the supernatant fluid just above the cell layer which soon increases in intensity and rises toward the surface. This blood, of course, should be thrown away as its use would be dangerous.

4. TRANSFUSION OF THE BLOOD.

(a) Preparation of the Blood for Transfusion.

The supernatant fluid is drawn off by means of a siphon apparatus shown in Fig. 2. The glass tube and stopper are sterilized either by dry heat or boiling. The tube is placed in the bottle so that its lower end reaches almost to the blood layer. Suction by mouth is made at the end of

FIG. 2.

the rubber tube, which need not be sterile. The only precaution necessary is that the liquid should be sucked up steadily and the suction released only when the column of fluid has reached the glass connexion (A), which is below the bottom of the bottle.

If the blood has been stored for some time the cells may have sedimented to a volume below that of the original amount of blood withdrawn. In this case a diluting fluid is added to bring the volume of a cell suspension at least to that of the original amount of blood. A 2.5 per cent. solution of gelatin in normal saline* was used for this purpose, on the theory that such a solution would remain in the circulation much longer than salt solution alone.

Transfusions of large fluid bulk were found to be desirable, so that the total volume of each transfusion was always made up to 1,000 c.cm. with gelatin solution. The diluting may be done either in the original bottle or in the transfusion bottle, which should always have a mark at the 1,000 c.cm. level. However, blood cells should not be poured when they are in a sediment more concentrated than normal blood.

The blood cell suspension is then gently agitated by a rotary motion, and poured through two layers of sterile gauze into the transfusion bottle described below (Fig. 3). Filtering the blood is necessary because occasional small clumps may form during sedimentation. The gauze is tucked into the wide-mouthed bottle with a pair of sterile forceps. The bottle is tilted slightly so that the blood flows down the side instead of falling to the bottom, which might injure the blood cells. The bottle is restoppered and placed in a glass jar containing water at a temperature of 106° to 107° F. If the water is maintained at this temperature, and the bottle is occasionally agitated, the blood becomes warm in a few minutes.

* This is Hogan's solution slightly modified. It is most easily prepared as follows: 25 grams of purest quality gelatin (gold seal, finest quality) are dissolved in 200 c.cm. distilled water, to which is added 2 grams of NaCl. The mixture is boiled for fifteen to twenty minutes in a water bath to bring about complete solution of the gelatin. It is then filtered while hot through coarse filter paper (Chardin agar)—preferably in a hot filter—and autoclaved for one hour at 124° C. When desired for use, the gelatin is melted in warm water and poured into 800 c.cm. of sterile 0.9 per cent. NaCl solution to which has been added 0.2 per cent. sodium carbonate— Na_2CO_3 (10 H₂O). The water used for this solution should be freshly distilled.

(b) Apparatus.

The apparatus for transmission is shown in Fig. 3.

A wide-mouthed quart bottle is chosen for giving the blood, the stopper and neck of which should be protected before sterilization by a gauze covering. The needle employed has a bore about half the size of that used for bleeding. The length is not important. As shown in the illustration, the needle is attached to a short glass tube by means of a small piece of rubber tubing. The free end of the glass tube is thrust into the end of the long rubber tube (D) after the needle is in the vein. The rubber tube (D) may be of any convenient length. The glass tube (G) is bent so that the end projects into the lowest part of the bottle. In this way almost every drop of blood in the bottle may be given. The needle, with connexions (B) and (C) and the stopcock, are boiled up before use. The remainder of the apparatus is dry sterilized.

(c) Procedure of Transfusion.

The recipient's arm is prepared in a manner similar to that described for the donor, and a small amount of novocain injected into the site chosen for the vein puncture. The apparatus is assembled according to the diagram in Fig. 3. The bottle is kept in warm water during the entire process. It is well to tie the rubber stopper down to the bottle with two strips of adhesive plaster in order to prevent it from flying out when the pressure increases. After these preparations have been completed sufficient

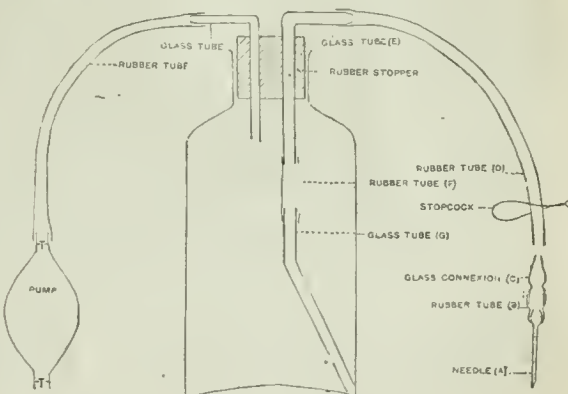

FIG. 3.

pressure is put on the pump to fill the apparatus with blood, and the stopcock is closed. The tourniquet is then tightened. As soon as the needle enters the vein blood flows out through the short glass tube, the tourniquet is immediately released, the apparatus is connected up, the stopcock opened, and the pump started. This technique is simple, and, if carried out carefully, there is no danger of forcing air into the vein. If the veins are collapsed or constricted, as is the case with certain patients in shock, it may be necessary to cut down on the vein and use a glass or silver cannula instead of the needle.

By using a needle it is scarcely possible to force the blood in too rapidly. With a cannula care must be taken to go slowly. Ten minutes should be the minimum time for the introduction of 500 c.cm. of blood. Care should also be taken to close the stopcock before the air bubbles begin to pass up the tube.

RESULTS OF TRANSFUSION.

The blood used for transfusion had been kept varying periods of time up to twenty-six days. The majority of the transfusions were given with blood preserved from ten days to two weeks. The patients transfused included cases of haemorrhage, shock, and sepsis—chiefly the two former. An attempt was made to choose only those cases who would probably die without transfusion and yet who had a chance of recovery if given blood—that is, the only moderately serious and the apparently hopeless cases were excluded. (Indications governing the choice of cases for transfusion will be discussed in detail in a subsequent paper.) The amounts given in a single transfusion varied from 500 c.cm. to 1,000 c.cm., depending on the type of case. If the condition was one of

marked anaemia the blood sediments of two large bottles were combined. Where the anaemia was less severe a large bottle and a small one—750 c.cm.—were given. In cases judged to be chiefly shock 500 c.cm. amounts were used. The total fluid bulk of the transfusion, as before stated, was always made up to 1,000 c.cm. with gelatin solution.

The effect of transfusion with preserved blood was fully as striking as that observed after the giving of freshly drawn blood. There was the same marked improvement in colour, the pulse became slower and stronger, and the blood pressure showed an increase of 20 to 40 points. Furthermore, this improvement was maintained and increased. Patients transfused before operation stood the operation procedure well, and subsequent progress was quite as good as in those cases transfused by the usual methods.

Haemoglobin estimations* were made before and after transfusion, and in certain cases the red cells were counted as well. It was hoped that these determinations would give fairly accurate information as to the length of time the preserved blood cells remained in the circulation. The results of the tests, however, were inconclusive in many cases on account of the progressive fall in haemoglobin per cent. which occurs after acute blood loss and shock. Haemoglobin estimations after transfusion with fresh blood showed variations identical with those occurring after preserved blood cell transfusion. In some instances there was a rise of 5 per cent. to 20 per cent. afterwards, which was maintained during the time the patients were under observation—periods of from two to eight days. In other cases the haemoglobin per cent. showed a temporary increase after transfusion, followed next day by a drop to the previous level, or in one or two instances to a point even lower than it had been before transfusion. Still others showed very little change in the haemoglobin following transfusion. These findings had no apparent connexion with the length of time the blood had been kept previous to transfusion.

There were no reactions either during the giving of the blood or afterwards. The only possible exception to this was in a case of gas gangrene who complained of slight chilliness and shivered a little immediately after transfusion, which very soon passed off without other symptoms.

No evidence of increased blood destruction after transfusion was observed. The urine was studied for three to four days subsequent to transfusion in patients who had received blood kept nine to twelve days. Spectroscopic tests for haemoglobin and urobilin were negative except in two cases who developed gas gangrene two to three days after transfusion when a faint trace of urobilin appeared in the urine. Tests for bile made by the nitric acid method were negative. Unfortunately it was not possible under the conditions obtaining to test the urine of patients transfused with blood kept for longer periods than twelve days.

In all, twenty-two transfusions were given to twenty individuals. Of these, eleven were discharged to the base in good condition and nine died—a mortality of 45 per cent. Those patients who later died all showed the immediate stimulating effect of transfusion with one exception, a case of profound anaemia who died just after transfusion. Four died within forty-eight hours, of gas gangrene; and four lived from two to six days, dying ultimately from the same cause. Three of the four patients in this last mentioned group showed very marked improvement subsequent to transfusion; they stood operation well and were making satisfactory progress several days afterwards when gas infection appeared.

The length of time the blood had been kept appeared to have no influence on its beneficial effect. The improvement in those cases transfused with blood kept three weeks or more seemed to be just as marked as in those who received blood preserved for much shorter periods. It is probable that four weeks represents about the limit to which blood can be kept for transfusion, as the red cells usually begin to disintegrate soon after this. Judging by the experimental results quoted in the beginning of the paper, it will do no harm to inject blood cells kept beyond the period of their viability provided they are still intact,

but much benefit cannot be expected from such a transfusion.

The criticism may be raised that blood deprived of its plasma cannot be as efficient a restorative as whole blood. In conditions of low blood pressure due to shock the plasma is probably a valuable part of the transfused blood. For this reason gelatin solution is added to the red cells in order to approximate more nearly the normal consistency of blood. However, in cases of simple exsanguination, the red blood cells alone are probably quite sufficient to restore the circulation to its normal condition. Abel, of Johns Hopkins, has shown this experimentally by removing large amounts of blood from dogs and replacing only the corpuscles suspended in Locke's solution. Bleedings were repeated in the same animal until all his plasma had been replaced by Locke's solution. The animal suffered no apparent ill effects from the procedure.

ADVANTAGES OF PRESERVED BLOOD CELLS FOR TRANSFUSION.

The chief value of this method lies in the convenience of having a large quantity of blood on hand for a rush. Just before a recent attack the writer laid in a store of twenty pints of blood, which furnished sufficient material for fourteen transfusions. During the first two or three days of the fighting it would have been difficult to give transfusions in the usual way, not only on account of the time element involved, but also because of the scarcity of donors. This was due to the fact that the casualty clearing station at which this work was done received at first an unusually large proportion of the more seriously wounded, the slightly wounded being sent further on. As donors are picked from among those with trivial wounds the immediately available supply was small. This state of affairs became apparent when the stock of preserved blood had been exhausted, which occurred on the third day. It was then necessary to resort to "immediate" transfusions, and much time was consumed in finding suitable donors.

Another marked advantage is the time saved in giving the transfusions. The procedure can be carried out in a relatively short space of time by one medical officer and an orderly assistant. The technique is simple, and can be acquired easily.

The blood can be given at the bedside. A patient in shock may be considerably injured by carrying to the operating room or even lifting him out of bed on to a table near by. Furthermore, under rush conditions it is a great convenience to be able to do a transfusion without the necessity of having the donor and recipient together. Another consideration is the operating room space saved by giving the transfusions in the resuscitation ward.

It is possible by this method to give a large amount of blood in a single transfusion. This is particularly desirable in cases of severe anaemia. Very often it is not feasible under the conditions existing during an attack to give large "immediate" transfusions because of the fact that the withdrawal of amounts of blood greater than 600 c.cm., or at most 700 c.cm., from donors who are frequently suffering from varying degrees of exhaustion, may weaken them to an unjustifiable extent. In those cases of marked anaemia who were given preserved blood cells a single transfusion of 1,000 c.cm. was sufficient, while similar cases transfused with 500 to 600 c.cm. of fresh blood not infrequently needed a second transfusion.

Fluid may be added to the preserved blood cells before transfusions to any amount desired. In conditions where the circulation has been depleted, the introduction of a large quantity of a suitable fluid is indicated. Solutions of gelatin or gum acacia serve this purpose best. It was found that transfusions of large fluid bulk obviated the necessity which might otherwise arise of a subsequent injection of fluid or even of a second transfusion.

During periods of only moderate activity, when there is no need of a large store of blood, it has been found very convenient to keep a small quantity of preserved blood on hand for use at night. This has two advantages: One is the time saved; the other is avoidance of the difficulty which may arise in finding a suitable donor at night, as it is not always possible during busy times to keep a list of Group IV donors in reserve.

Transportation.

It has been found possible to transport preserved blood cells for a considerable distance. On several occasions

* Haemoglobin tests were made with a modified Sahli haemoglobinometer.

bottles of sedimented blood were carried in an ambulance for six or eight miles over rough roads without any damage to the cells. There was a slight stirring up of the surface of the sedimented layer, which coloured the supernatant fluid to a moderate degree. Judging by the colour, this contained perhaps 10 c.cm. of suspended blood cells, not more. Thus, if the blood had been used immediately after transportation, very little would have been lost in the siphonage. On standing, the blood cells soon settled, leaving a clear fluid above. It was considered possible that the red blood cells below the surface might have been injured during transit and the resulting haemolysis concealed in the deeper layers. Accordingly, the whole sediment was thoroughly stirred up, then allowed to sediment. As before, the supernatant fluid showed no sign of haemolysis.

SUMMARY.

As first found by Rous and Turner, it is possible to preserve living human red blood cells for several weeks in a solution of dextrose and citrate, when kept at ice-box temperature. This method of keeping blood has been made use of recently for giving transfusions at casualty clearing stations during a rush period. A quantity of blood was stored up beforehand ready for use when needed. The blood was kept for varying periods up to twenty-six days before transfusion. Twenty-two transfusions were given to twenty cases by this method. The majority of these were cases of haemorrhage. The results of preserved blood transfusion were quite as striking as those seen after transfusion with blood freshly drawn. There was the same marked improvement, the patients stood operation well, and subsequent progress was quite as good as in those cases transfused by the usual methods. The introduction of kept red blood cells had no apparent harmful effect, as there were no reactions or evidence of increased haemolysis after transfusion.

The chief advantage of this method over other methods of transfusion in current use is the great convenience of having a stock of blood on hand for busy times. The transfusions can be given relatively quickly, and the technique, which is simple and easily acquired, can be carried out entirely by one medical officer.

Experiments in the transportation of preserved blood have shown that it can be carried a considerable distance without injury.

BLOOD TRANSFUSION IN A FIELD AMBULANCE.

BY

CAPTAIN NORMAN M. GUIOU, C.A.M.C.

THE work described in this article was undertaken as the result of lectures delivered by Major McNee and Captain Sladden, R.A.M.C., and Major Harrison, C.A.M.C., and is an endeavour to show that the operation of blood transfusion is easily applicable to the forward area, where it is most needed.

Group Testing.

As the mobile laboratory was busy preparing serums for casualty clearing stations, a few cubic centimetres of II and III serums were obtained from the Lisler Institute. A group of dressers of different sections was assembled and shown the macroscopic test as used by Major McNee. A drop each of II and III serums are placed at opposite ends of a slide, and into these are stirred small quantities of blood picked up in the eye of the needle used for pricking the finger. After rocking gently, the slide is covered with a Record syringe box lid for four minutes, rocked again, allowed to stand another minute, and then read. After two demonstrations the dressers could do the test, and proceeded under supervision to test one another and their comrades. Stock serums were prepared from a clear-cut II and III by bleeding into a 2 oz. conical graduate, loosening the clot round the top one hour later with a probe, and next morning transferring the supernatant serum to boiled antitetanic serum bottles with an eye dropper and

adding one drop of 5 per cent. carbolic for every ten drops of serum. These bottles, together with two eye droppers marked II and III and a safety-pin box of slides, fitted easily into an ordinary oblong cigarette box. On the inside of the lid the following table was pasted:

	Red Blood Cells.	Red Blood Cells.	Red Blood Cells.	Red Blood Cells.	Frequency of Group
Serum 1 ...	1-	2	3	4	Per cent
Serum 2 .	+	-	-	-	10
Serum 3 ...	+	-	-	-	10
Serum 4 ...	-	+	+	-	42

+ = Agglutination. - = No agglutination

The important point is the effect of the patient's plasma on the cells to be introduced.

This test case fitted readily into one of the spaces in the field medical pannier allotted to tubes of vaseline. With it a dresser could determine the blood group of a volunteer and a patient in a few minutes.

The Operation.

The syringe method with glass cannulae in the veins was used; needles were tried once, but the dresser assistant got his out of the vein and trouble resulted. Two inches of the thick-walled rubber tubing of the aspiration set were fitted to each cannula, one inch being free to receive the end of the syringe. Five per cent. carbolic was used for numbing and sterilizing the skin; the veins were dissected out and ligatures placed by the medical officer, and then he and the dresser together cut their respective veins and introduced the cannulae—that in the donor being directed distally. The cannulae were held in place and blocked by pinching the rubber tubing. The 20 c.cm. glass syringes, four in number, fitted snugly into the rubber connexions and were kept going in a cycle, being washed out each time in a vessel of boiled saline by a second dresser, and laid on a piece of sterile gauze ready for use. Plugging of the donor's cannula by the wall of the vein being drawn against its end may be overcome by stopping the suction on the syringe and sliding the cannula slightly in or out. The syringes and cannulae may be carried, sterile, in an old tablet tin (obtained from advanced dépôt medical stores) with the partitions removed.

Illustrative Cases.

CASE I.

Severe lacerated shell wound of the left thigh, and fracture of the femur, admitted to dressing station with tourniquet and Thomas splint applied. Intravenous injection of one pint 5 per cent. gum and 4 per cent. sodium bicarbonate* produced a slight improvement in the pulse. The blood was tested, and found to belong to Group IV. A robust infantryman, buried by shell, offered some blood, but turned out to belong to Group II, and had to be rejected. A slightly wounded corporal, Group IV, volunteered, and a pint of his blood was transfused without difficulty by the syringe method. Some improvement was noted, and the patient was warmed up and sent on. He died just before reaching the casualty clearing station. We have since thought that if this case had been given more blood, and allowed to warm up longer in the dressing station, he might have survived the long ambulance journey.

CASE II.

Shell wound of the thigh and fracture of the femur brought into dressing station with legs tied together and considerable blood in the stretcher; morphine gr. 4 had already been given. A tourniquet was at once applied and 1 oz. 50 per cent. ether in liquid paraffin given between mouthfuls of port wine (Gwathmey's oral analgesia). He was allowed to warm up for fifteen minutes; meanwhile his blood was found to belong to Group II. A Thomas splint was then applied without pain, the wounds packed, the tourniquet removed, and one pint gum solution given intravenously; he was wrapped up and allowed to remain on a heated stretcher. In less than an hour he was found to be in shock—extremely pale with bloodless conjunctivae and lead-blue lips, barely conscious, but the radial pulse still faintly perceptible. A donor (Group IV) with a sprained ankle was found and 800 c.cm. blood transfused. After the operation the patient's neck and face were definitely red and his cheeks warm to the touch. His mental state improved immediately, and he raised his head and smiled and talked to the dressers. After drinking some tea and cafe-au-lait, resting meanwhile on a heated stretcher, he was sent on to a casualty clearing station surrounded with hot-water bottles, where he

* Since the publication of Professor Bayliss's article we have changed our gum formula to 5 per cent. gum and 0.9 per cent. sodium chloride.

arrived, according to the officer on duty, "recovered from his shock and in excellent condition." It seems probable that if this case had been transfused immediately he would never have developed the shock which, untreated, would undoubtedly have meant his death before he reached the casualty clearing station.

Conclusion.

Although there has been opportunity to carry out the operation on a very few cases as yet, there is no doubt that blood transfusion by the syringe method can be done easily in an A.D.S., and, in the writer's opinion, could be done in an average regimental aid post; and by its use some cases of severe primary haemorrhage which would in the natural course of events die in the forward area will live to reach the casualty clearing station.

Indebtedness is especially acknowledged to Captain Cowell and to the teaching of the — Army R.A.M.C. school, as well as to Lieut.-Colonel T. J. F. Murphy, D.S.O., C.A.M.C., commanding the field ambulance.

AMOEBI ABSCCESS OF THE LIVER.

BY

CAPTAIN R. J. McNEILL LOVE, R.A.M.C.(T.C.),

MEDICAL OFFICER IN CHARGE OF SURGICAL DIVISION. — BRITISH GENERAL HOSPITAL, MESOPOTAMIA EXPEDITIONARY FORCE.

AMOEBI abscesses of the liver are by no means uncommon in Mesopotamia, and are of interest for the manner in which the signs and symptoms frequently differ from those usually described in surgical textbooks. During the last twelve months over twenty cases have come under my observation in this hospital, besides many others already treated and passing through in various stages of convalescence during the course of evacuation from other hospitals.

As thousands of men have returned and will continue to return to England with active amoebae in the large intestine, I venture to record some of the principal features of the last twenty cases admitted to this hospital among British troops.

Signs and Symptoms.

Patients usually give a history of former attacks of diarrhoea or actual passage of blood and mucus, and *Entamoeba histolytica* can usually be found in the stools. The onset of the disease is usually insidious, loss of appetite, malaise or wasting causing the patient to report sick. In a few cases, however, the disease runs an acute course and the onset is surprisingly rapid. In one case in which one abscess was opened and four more found *post mortem*, the patient was apparently well and doing full duty until eight days before the operation; as death occurred ten days later, the whole illness lasted only eighteen days. In another patient, who had been some days in hospital under observation, the temperature was not above 99° until three days prior to a large abscess being opened.

Pain may be a marked symptom, indicating that the abscess is near the surface of the liver, and is sometimes a useful guide to its position. Referred pain in the right shoulder suggests subdiaphragmatic irritation of the phrenic nerve, whereas pain in the epigastrium or loins may indicate an abscess in the lower part of the liver.

Vomiting occasionally occurs, but jaundice is rare; a slight icteric tint, with a trace of bile in the urine only, was noticed in one case.

With an abscess of large size or long duration, cachexia and signs of septic absorption—oscillating temperature, sweats, rigors, furred tongue, etc.—are well marked, but an interesting feature is that the pulse-rate is often relatively slow in proportion to the temperature. (The chart shows the temperature in a typical case.)

The cytological examination of the blood is of great importance; the leucocytosis and an increase in the percentage of polymorphonuclear cells so characteristic of pus are usually well marked. The most striking blood picture in this series of twenty cases was a total white cell count of 43,000 per cubic millimetre (with 89.8 per cent. polymorphs), and the least striking showed 12,500 white cells (74 per cent. polymorphs). There seem to be no other constant blood changes, and eosinophils are not usually present in greater numbers than normally.

The x-ray screen is useful in diagnosis in doubtful cases, or to afford confirmation where a liver abscess is suspected. Three points are of assistance: first, increase in the size of the liver in an upward direction; secondly, limitation of movement of the diaphragm, the normal 1 in. to 1½ in. being reduced to ½ in. or ¾ in. even on deep inspiration; and thirdly, the normal dome-shaped diaphragmatic convexity may be distorted by a bulging representing a pointing abscess.

Course.

There is some clinical evidence to show that small abscesses may be absorbed, and this is especially probable in cases where the resistance of the tissues to amoebic invasion has been increased by emetine injections.

The usual course in Mesopotamia seems to be rapidly progressive, and sometimes surprisingly so, and is well illustrated in one case in which the patient had never left England prior to his embarkation for Mesopotamia, so that the possibility of previous amoebic infection is very remote. He had been in Mesopotamia less than a month when he was admitted and an abscess containing nearly a pint of pus evacuated from the liver, amoebae being found in the pus in the course of a few days.

In most cases the abscess apparently increases steadily in size and may rupture through the diaphragm or into the peritoneal cavity; this being a comparatively slow process, it is well shut off by adhesions among the neighbouring organs.

In one case liver abscess was diagnosed, and it was decided to operate on the following day, but the patient suddenly collapsed and died in a few minutes. *Post mortem* it was found that two large abscesses were present, one of which had ruptured into the inferior vena cava, death occurring from the resultant haemorrhage.

Diagnosis.

In well marked cases the diagnosis presents little difficulty—the enlargement of the liver, signs of toxæmia, blood picture and x-ray screen, all pointing to the correct diagnosis. It may be difficult to distinguish between a right-sided empyema and a liver abscess. The latter, if situated in the upper right lobe, may cause compression of the lung, with dullness and feeble breath sounds as high up as the angle of the scapula; also some fluid in the pleural sac may accompany a liver abscess, as in one case admitted as pleural effusion in which the liver abscess was discovered subsequently. In these cases the final appeal may be to the exploring needle, the diagnosis resting on the site of the discovered pus.

The increase in the percentage of polymorphonuclear cells in the blood is of much assistance in distinguishing between simple and suppurative inflammation of the liver. A good illustration of the value of the differential cytological examination was that of a patient admitted with an enlarged and painful liver, slight fever, and diarrhoea. His total white cell count was 18,500 per c.mm., but of these only 60 per cent. were polymorphonuclear. A diagnosis of dysenteric hepatitis was made, and the condition cleared up with dieting and hypodermic injections of emetine.

In two cases where the abscess was in the lower part of the right lobe and situated near the mid-line, the

CHART I.—E, Emetine, gr. 1; o, operation. Quinine, gr. 30, was given on June 7th and June 8th. Blood film examined for malaria on June 6th, and blood culture for enteric group on June 12th; both gave negative results. The patient was sent to the base on June 30th.

physical signs so much resembled those of an enlarged and infected gall bladder that the diagnosis of liver abscess was only confirmed on the operating table. A liver abscess in the posterior part of the right lobe may simulate a perinephritic abscess, especially as this latter condition is frequently seen in connexion with dysentery. An examination of the urine and signs of psosas irritation help to clear the diagnosis. Other cases of subdiaphragmatic suppuration—for example, those of gastric or intestinal origin—can usually be traced to their primary lesion.

Treatment.

The presence of pus is confirmed by the exploring needle; the exploration should always be conducted in the theatre, so that, if successful, the complete operation can be proceeded with. It is important to use a wide-bore needle, as the pus is usually thick and contains clots of lymph liable to block the needle. In one case in which the presence of pus was a moral certainty eight punctures were made before the abscess was discovered, and thick pus aspirated; probably the needle had on one or more occasions tapped the abscess, but the pus did not flow.

In this hospital it is the practice to leave the needle in the abscess cavity and excise a sufficiency of the ribs immediately below the needle. Well formed adhesions may be found between the parietal pleura and the diaphragm; it is, however, safer not to trust to them to protect the pleural cavity, but to insert a few points of suture between the parietal pleura and diaphragm. The diaphragm is then incised, and, using the needle as a guide, liver tissue is gently broken down until the abscess cavity is reached, when a drainage tube wrapped in gauze is inserted. The sinus usually heals readily, and in some cases syringing with weak quinine solution or eusol expedites closure. A course of emetine, 1 grain daily for twelve days, is usually given. I have seen cases in which the abscess was aspirated and a solution of quinine bichloride (30 grains in 10 oz. of water) injected into the cavity; the patients apparently were convalescing satisfactorily, the evacuated pus doubtless being sterile. However, in one case which was drained in the usual manner the convalescence was retarded until a second abscess discharged itself into the existing sinus. This abscess was unsuspected.

When the abscess is in the lower part of the liver, or has already ruptured into the general peritoneal cavity, the abdomen is opened with the usual precautions for the protection of the peritoneum, and drainage carried out in the usual way.

Prognosis and Summary.

The prognosis of liver abscesses in Mesopotamia is unfavourable, the chief reason being that although one abscess may be satisfactorily drained others are present which may be undiscovered or undiagnosed. In one case in addition to one abscess drained, five others were found *post mortem*; live amoebae were found in the pus.

Another factor which increases the severity of the disease is the acuteness of the course and the consequent grave toxicæmic symptoms. Coupled with this is the fact that the patient is often already debilitated from trying conditions in a climate which taxes the resources of the most robust, and consequently has little resistance to any infection.

I append a summary of twenty cases upon which these notes are based:

Apparently cured and patient evacuated*	...	8
One or more abscesses drained at operation, but further abscesses found <i>post mortem</i>	8
Abscess suspected, undiscovered on needling, found <i>post mortem</i> to be in the Spiegelian lobe	1
Two abscesses, one of which ruptured into the inferior vena cava; death from hæmorrhage	1
Death due to post-operative shock (no other abscesses)	1
Single abscess drained, but patient did not respond and died seventeen days later from æsthenia	1
Apparently cured	7
Minimum mortality, 65 per cent.		

* One of these cases subsequently died at another hospital from a second abscess.

It will thus be seen that liver abscess contributes substantially to the mortality and disablement among troops

in this campaign, and during the last hot season in this hospital more cases of liver abscess found their way to the *post-mortem* room than cases of actual dysentery. Owing to the numbers of men who will return to England infected with *Entamoeba histolytica* there is every possibility that this disease will manifest itself among them. Practically every one who has been resident in Mesopotamia for a few months is a carrier of *E. histolytica*, besides many another protozoon, and until we know more about the amoebic group it is difficult to trace their connexion with suppurative processes.

We are told by Knowles and Cole¹ that the "different species" of amoebae "are all one and the same organism . . . *Entamoeba coli communis*." Probably the *E. histolytica* is on the same pathological basis as the *B. coli*, and decreased resistance of the tissues or some stimulus applied to the organism causes it to become pathogenic, in which case the majority of the Mesopotamian Expeditionary Force are potential cases of liver abscess.

The most striking features of the condition as seen in Mesopotamia are the severity of the disease, often the acuteness of the onset and rapid course, and frequently the multiple nature of the abscess (in contradiction to the old name of "solitary abscess").

I am indebted to Lieut.-Colonel Davis, R.A.M.C., for permission to publish these notes, and to Captain J. Maitland Downie, R.A.M.C.(S.R.), for his assistance in collecting them.

ACUTE INTESTINAL OBSTRUCTION BY TAPEWORMS (*T. SAGINATA*):

MECHANICAL BLOCKING OF ILEO-CAECAL VALVE,
NECESSITATING LAPAROTOMY.

BY

J. B. CHRISTOPHERSON, M.A., M.D. CANTAB.,

F.R.C.P. LOND., F.R.C.S. ENG.,

AND

MUSTAFA IZZEDIN, M.D.,

KHARTOUM CIVIL HOSPITAL.

AMONGST the causes of intestinal obstruction due to the impaction of foreign bodies in the lumen of the bowel, accumulation of faeces, gall stones, intestinal calculi, and articles swallowed, such as teaspoons, are perhaps the best known.

The occurrence of intestinal worms causing acute obstruction is so infrequent in those countries where surgical textbooks are compiled, that authors as a rule do not even mention them as a possible cause. Nevertheless intestinal parasites are a very real source of danger in tropical countries, and they should be borne in mind as a possibility when exploratory operations are undertaken for acute intestinal obstruction.

Perret and Simon¹ summarize the histories of eleven cases of intestinal obstruction all due to *Ascaris lumbricoides*, all recorded since 1887. Most of these cases were diagnosed at the necropsy or during operation. They themselves record in the same paper another case. De Mello² and Masters³ have each recorded one case of intestinal obstruction due to *Ascaris lumbricoides*; in none of the three last was laparotomy resorted to.

No doubt *Ascaris lumbricoides* is the principal offender amongst intestinal worms, but the following case proves that laparotomy may have to be done for acute intestinal obstruction due to tapeworms (*Taenia saginata*).

O. H., male, Sudanese, aged 40, working as a gardener in the Palace Gardens at Khartoum, was admitted into Khartoum Civil Hospital with a very much distended belly and total suppression of faeces and flatus for sixteen hours. The attack seemed to come on suddenly but without pain at 5 p.m. He vomited twice during the night and the belly became more and more distended.

On admission to hospital the following morning the belly was much distended and tense, and the coils of intestines were very evident; peristalsis was plainly seen, and considerable discomfort was experienced owing to the distension, but there was no obvious pain; the pulse was 84, full and regular. He could pass neither faeces nor flatus; rectal examination revealed only an empty rectum. Two or three enemata were given without

effect. Vomiting of intestinal contents occurred twice after admission, and exploratory operation was decided on.

Operation.

Chloroform was given, and a median incision from the xiphoid cartilage to the symphysis pubis was made. The small intestines were explored from duodenum to ileo-caecal valve; they were very much distended. The large intestines were collapsed from the caecum onwards. No cause for the obstruction being found, it was thought to be a "kink" or some equally unsatisfactory thing.

The small intestines were taken from above downwards and passed through the gloved hands, segment by segment, to squeeze onwards the flatus. This was not satisfactory and the imprisoned air was evacuated by puncturing the bowel wall in at least six places with a medium sized trocar and allowing the air to escape. When the small intestines were thus relieved and collapsed they were replaced inside the peritoneal cavity—the whole of the distended small intestines (ileum) having been lying in a towel outside the abdomen whilst the abdominal cavity was searched—the wound was sewn up in one of the usual ways and the patient sent back to bed with the distension altogether relieved.

After-History.

No flatus or faeces were passed on the day of the operation, and next morning the abdomen was a little distended again, but during the morning flatus was passed and he felt more comfortable; two enemata (turpentine) were given.

On the third day after the operation a long tube was passed by the rectum and a dose of 1½ oz. of castor oil administered by the mouth; a large mass of tapeworms was passed. The patient passed bits of tapeworms on several occasions during the next three days.

Owing to a little leakage from one of the trocar punctures in a coil situated in the pelvis an abscess formed. This was localized, however, and although it became infected with *B. coli* and was very foul, recovery was retarded not more than two or three weeks.

Undoubtedly the mass of tapeworms (there were probably four or five separate ones, which measured when freed from intestinal debris two or three pints, had become blocked against the ileo-caecal valve, causing mechanical obstruction; and if this had not been relieved by manipulation of the intestines and evacuating the flatus, the patient would probably have died.

The principal points about the case appear to be the following: Absence of pain even at onset, or afterwards, although the obstruction was acute. There was discomfort certainly due to over-distension. There was very little, if any, collapse. The pulse was fairly good and, sixteen hours after symptoms commenced, was only 84. There was, however, fairly frequent vomiting of intestinal contents (in the cases recorded of obstruction due to *Ascaris lumbricoides* the worm was frequently vomited), but absence of acute pain and very little collapse, together with acute obstruction symptoms, may be taken, we think, as a characteristic of obstruction due to intestinal parasites.

In the case here described there was no question of delaying the operation, such a course was contraindicated by the vomiting, distension and peristalsis and total suppression of flatus and faeces. The obstruction was complete.

The diagnosis of the cause of intestinal obstruction is such an important subject that we do not think any apology is necessary for recording this case. Operations for intestinal obstruction are amongst the most fatal in surgery. Statistics place the mortality at 60 to 70 per cent., doubtless due to the fact that most cases are operated on when too late; but it is also due to the fact that diagnosis remains so often uncertain until after the abdomen has been opened, and to the fact that, even if a correct diagnosis is established before the abdominal incision is made, the condition of the parts involved is a matter of speculation, and is usually worse than is apparent from the symptom. Cases occur—as, for example, that here reported—in which the distension of the intestines is relieved (and presumably the cause of the obstruction), the intestines replaced, and still it is impossible to say what has been the cause, and we have to fall back on an unsatisfactory speculation—such as a "kink," for want of better knowledge. Let us have in mind that a mass of intestinal parasites may, especially in tropical countries, be the cause of acute intestinal obstruction.

Memoranda:

MEDICAL, SURGICAL, OBSTETRICAL.

INTESTINAL OBSTRUCTION DUE TO DIAPHRAGMATIC HERNIA.

J. B. was admitted to hospital on March 17th, 1918, in a collapsed condition. He complained of severe abdominal pains, with vomiting, and gave a history of several previous attacks of a similar nature. The abdomen was slightly distended, but no rigidity was present, and no acute tenderness on palpation. When first examined there was some tenderness over the descending colon, and on a second examination, a little later, tenderness was located in the middle line, between the umbilicus and pubes. The temperature on admission was 95° F., and remained sub-normal. The radial pulse was imperceptible. The heart was displaced to the right side, the left border being about half an inch to the left of the sternum; the sounds were feeble and the action rapid. Breathing was slightly laboured, but the respiratory sounds showed no sign of lung trouble. Over the lower half of the chest, on the left side, intestinal rumblings were heard mingling with breath sounds. The tongue was dry and slightly furred. The bowels had not moved for three days. A soap and water enema was given, but was returned, showing slight trace of blood and no faeces.

As pain still continued severe, morphine (2 grains) was given, and the general condition was treated by administration of brandy in small doses and hot-water bottles. No improvement resulted, though the pain was considerably eased. He got gradually weaker, and died on March 18th, 1918.

At the *post-mortem* examination the stomach was found to be greatly distended, extending to midway between the umbilicus and pubes. The caecum and large intestine were normal; the appendix was bound by adhesions to the caecum. There was at first sight no sign of small intestine in the abdominal cavity, but the ileo-caecal junction was found, and the ileum, when traced back, was found to disappear through the oesophageal opening of the diaphragm. Practically the whole of the small intestine was lying in the chest cavity on the left side, displacing the heart and left lung. Both the ascending and the descending portions of the loop of intestine passed through the oesophageal opening of the diaphragm along with the oesophagus. The stomach was full of faecal fluid under considerable tension. Two ulcers were found on the stomach wall, one near the pylorus and the other on the greater curvature. The part of the duodenum between the stomach and diaphragmatic opening was similarly distended and full of faecal fluid. The coils of intestine inside the chest cavity were slightly distended. The portion of ileum in the abdominal cavity was empty and contracted. The caecum and large intestine were normal and contained only a very small quantity of faeces. All the other organs in the abdomen were normal.

TREATMENT OF VENEREAL DISEASES.

The Diagnosis and Treatment of Venereal Diseases in General Practice,¹ by Colonel L. W. HARRISON, D.S.O., R.A.M.C., is a book addressed by a specialist to general practitioners, and, in spite of some faults of arrangement, will be found remarkably complete in its discussion of syphilis, and highly practical in its directions for treating both that disease and gonorrhoea. Most readers will turn to the section in which Colonel Harrison summarizes his experience of the treatment of syphilis. He would at present choose one of the organic arsenical compounds, either salvarsan or one of its chemical equivalents—arsenobillon, kharsivan, or diarsenol—which are given intravenously, or one of the "neo" compounds given intramuscularly. He advises the simultaneous use of

¹ *The Diagnosis and Treatment of Venereal Diseases in General Practice*. By L. W. Harrison, D.S.O., Lieut.-Colonel R.A.M.C. London: H. Frowde, and Hodder and Stoughton. 1918. (Demy 8vo, pp. xvii + 482; 16 plates; 84 figures. 21s. net.)

mercury, and employs potassium iodide also in suitable cases. He gives full directions for the injection of the arsenical remedies, and in discussing their value observes that though undoubtedly many cases have apparently been cured by comparatively short courses of treatment, yet others have relapsed after most careful and repeated courses. With regard to the question whether the treatment will prevent the later nervous disorders, such as tabes and general paralysis, Colonel Harrison adopts a cautious attitude; he admits that the time has not yet come to pronounce judgement. For early primary cases he gives an arsenical compound weekly for three weeks, and then again on the fifth and sixth, and eighth and ninth weeks. He prefers the intramuscular injection of one of the neo compounds. One grain of mercury is given intramuscularly weekly for the first eight weeks. For modifications of treatment according to circumstances the book itself must be consulted. In early secondary cases he follows the same general plan, but after an interval of three or four weeks gives another course of three or four injections of a salvarsan compound at intervals of seven or ten days. If the Wassermann reaction be positive at the end of 100 to 110 days, he considers it advisable to repeat the whole course after an interval of about eight weeks. In later cases with active symptoms he advises a series of short courses of four injections each, with an interval of about eight weeks between the courses, and potassium iodide for two weeks in each interval. Before deciding to suspend treatment the cerebro-spinal fluid should be examined as well as the blood, and if anything pathological is found the treatment should be renewed after a suitable interval. Subsequently, during the first year the patient should be examined clinically at intervals of not more than a month and his blood tested at intervals of not more than three months. When treatment has been suspended for a year a small provocative injection of one of the arsenical compounds should be given and the blood serum tested on the second, fourth, seventh, thirteenth, and twenty-first days. When so many tests are not possible it is on the seventh day that provoked reaction is most likely to be caught. The cerebro-spinal fluid should also be examined a week after the provocative injection. In the second year a test every six months should suffice. We cannot follow Colonel Harrison in his discussion on the treatment of syphilis of the central nervous system, which is very detailed. He has short notes on galy, luagol, and on mercurial preparations, and the methods of administration are fully described. Altogether the sections of the book dealing with syphilis are very complete. The sections on gonorrhoea are less full, but there is an excellent chapter on local treatment. It will have been gathered from what has been said that the book, while comprehensive in its treatment of the subject, is at the same time thoroughly practical in its discussion of details.

Dr. OTTO MAY's small work on the *Prevention of Venereal Diseases*² is written mainly from the standpoint of preventive medicine, but with full recognition of the social and educational side of the campaign against these diseases. The keynote of the book is struck in this sentence: "The elimination of venereal diseases is a complex problem, incapable of solution by any single method." What the various measures are and how much the author expects from each are clearly set out in five short chapters and a summary. The first three chapters—on education and instruction, on treatment in relation to prevention, and on prostitution and venereal disease—bring these questions to a practical focus without raising controversial issues. The admirable work of the National Council for Combating Venereal Diseases is bringing home to the public the fact that science, ethics, and common-sense have reached a working agreement upon these matters. In the fourth chapter, as he gives due warning in the preface, Dr. May parts company with the National Council upon the vexed question of personal prevention or artificial prophylaxis, which was debated at some length in our columns a year or so ago, and has been brought to the notice of the educated public by the outspoken writings of Sir Bryan Donkin. From what has been said it will be clear that Dr. May

does not belittle other means of checking the spread of venereal disease; but in this chapter and elsewhere he states the case, as strongly as it can be put but with fairness to those who hold the opposite view, for looking on "prophylaxis" as a legitimate and valuable ally in the campaign against these diseases; without its aid, he believes, the battle cannot be won. His argument should be read by all who wish to form an unbiassed opinion, because, although he holds strong views on one side, he is at pains not to misrepresent the position of others who with equal sincerity have come to a different conclusion. In contrasting the value of "early treatment" with that of the "prophylactic outfit" he recognizes that neither method is infallible: the former is often not early enough, and the latter is apt to break down in practice. But his contention is that both methods are decidedly useful; that there is no fundamental ethical difference between them; that both should therefore be encouraged; and that their provision ought not to be left to private enterprise.

Captain LUMB's little book on the systematic treatment of gonorrhoea³ is a useful handbook for those engaged in the treatment of this disease, whether at civil or military centres or in private practice. It is clear and concise, and its principles are sound. The chief feature of the author's scheme of treatment is a combination of gonococcal and staphylococcal vaccines, which is recommended both in acute and chronic gonorrhoea. Captain Lumb's original article on this subject appeared recently in this JOURNAL (October 6th, 1917).

BIPP.

PROFESSOR RUTHERFORD MORISON has put into a small volume⁴ his considered opinion of the value of bipp—that is to say, a paste consisting of iodoform 16 oz., bismuth subnitrate 8 oz., and liquid paraffin 8 oz. or a sufficient quantity—in the treatment of wounds. A satisfactory paste, the author says, should leave a thin adherent even smear over the surface of the wound, and adds that many of the preparations sold do not fulfil this requirement. He gave an account of his methods in the JOURNAL of October 20th, 1917, so that we need not go through the recommendations of the book at length. We may note incidentally, however, the remarkable results obtained in the treatment of cerebral hernia. Professor Rutherford Morison's general conclusion is: "That if it is possible to get to the bottom of an infected wound so that it can be thoroughly cleansed mechanically, and suitable antiseptics be applied, the wound can be closed at once with interrupted sutures, always with impunity, and many times with the prospect of finding it healed when the dressing is removed for the first time at the end of three weeks." But he does not recommend the method for use at the front, for four reasons: the first is the danger of gas gangrene following closure of fresh wounds; the second is that the method must be carried out with such careful attention to detail as to take considerable time; the third is that both bismuth and iodoform may prevent satisfactory x-ray pictures; and the fourth that there may be more danger of poisonous absorption of bismuth or iodoform in fresh wounds than later on. The book is a convenient guide to a method which is undoubtedly of very considerable value. The appeal the author makes to surgeons to test it will have all the more force because he confesses in his preface that it took him a long time to realize the truth of what he saw, so opposed was it to all ordinary surgical canons. In conclusion we may quote his opening words: "War has taught surgeons once more the value of Lord Lister's work on the use of antiseptics in wound treatment, and now it has proved that with their aid primary union after suture of infected suppurating wounds is possible."

NOTES ON BOOKS.

*The Medical Register for 1918*⁵ has just been published, and contains as usual the list of registered medical practitioners, including the colonial and foreign lists. The

² *The Systematic Treatment of Gonorrhoea*. By N. P. L. Lumb, temporary Captain R.A.M.C. London: H. K. Lewis. 1918. (Cr. 8vo, pp. viii + 129. 4s. 6d. net.)

³ *Treatment of War Wounds*. By Rutherford Morison, Professor of Surgery, Durham University. London: Henry Frowde, and Hodder and Stoughton. 1918. (Fcap. 8vo, pp. 72. 2s. 6d.)

⁴ *The Medical Register for 1918*. London: Published for the General Medical Council by Constable and Co. 1918. (Pp. 1280. 10s. 6d.)

⁵ *The Prevention of Venereal Diseases*. By Otto May, M.A., M.D., M.R.C.P., late Honorary Secretary National Council for Combating Venereal Diseases. London: Henry Frowde, and Hodder and Stoughton. 1918. (Crown 8vo, pp. 240. Price 7s. 6d. net.)

total number of names is 43,819, giving a net increase of 338 over the total for the previous year. The number of names added by registration during 1917 was 1,134, being 68 less than in 1916, and 159 less than the average for the last five years. The number of names removed from the *Register* on intimation of death is given as 801, but, as the President pointed out at the last session of the General Medical Council, it is certain that the losses of the year are not yet fully known. The *Dentists' Register* for 1918⁶ has also been issued. The total number of names is now 5,524, as compared with 5,512 in 1917. The number of dentists registered without licence or degree is now 1,274, or 23 per cent. of the whole.

⁶ The *Dentists' Register* for 1918. London: Published for the General Medical Council by Constable and Co. 1918. (Pp. 167. 3s. 4d.)

NATIONAL COUNCIL FOR COMBATING VENEREAL DISEASES.

THE third annual meeting of the National Council for Combating Venereal Diseases was held at Caxton Hall, Westminster, on June 17th. Lord SYDENHAM, who presided, said that the Council had fifty-four branches, including three in Scotland and one in Ulster. In the year ending May 31st, 1,323 lectures to civilians had been arranged by the branches, as well as 168 lectures by the central body in areas which the branches did not cover. A central council had been established in South Africa, and it was hoped that shortly Canada and every state in Australia would follow suit. In Bombay there was also an affiliated branch. The Council was in communication with the War Office on the difficult problem of demobilization, and was also doing all that it could in the matter of dealing with infected pregnant women and with mentally deficient persons who were contaminated.

Mr. HAYES FISHER, M.P., President of the Local Government Board, said that 135 local authorities in this country had now arranged for laboratories, and 136 had submitted schemes under the regulations, of which 127 had been approved. The hospitals which were actually treating these cases at the present time numbered 124, and all were provided with free supplies of salvarsan substitutes for the treatment of syphilis by qualified practitioners. The returns for 1917, the first full year of the system, were not yet complete, but, so far as they went, they showed that 22,000 cases had been dealt with in these hospitals, and that there had been 197,000 visits to the out-patient departments. Some areas were less active in this matter than others, but London and the Home Counties set a good example, as did some districts in the north, notably Durham. Mr. Hayes Fisher said that there was little chance of legislation this session, if, indeed, there was any during the lifetime of a war Parliament. But, short of legislation, more provision might be made in the way of lying-in hospitals for expectant mothers who had been infected; and another work which the local authorities, especially in industrial districts, might undertake was the establishment of hostels for shop assistants and domestic servants who had got into trouble. With regard to the Criminal Law Amendment Bill, he thought that Clause 5, which dealt with both sexes alike, might well be formed into a one-clause measure, which would have good hope of passage, and this would do away with Regulation 40 D, at which many took umbrage.

Mrs. GORTO, the general secretary of the Council, dealt with the question of notification, which, she said, was already on the statute books of Western Australia, New Zealand, and, in a limited sense, Canada, but apparently it was not very vigorously in effect in any of the dominions. In Western Australia there was a record of the results of the first fifteen weeks of working, which showed that only 135 and 153 men had been notified as suffering from syphilis and from gonorrhoea respectively, and only about 20 or 30 women in each of the categories. That showed that any effective notification must wait until the public themselves were convinced of its need. She thought it was urgent to educate the British public up to the point of notification in some form or other to be operable before demobilization.

Mr. E. B. TURNER said that if a doctor, knowing that a patient suffering from venereal disease was about to be married, spoke of it to the other contracting party or to

his or her parents or guardians, he laid himself open to an action for libel, and, what was an even greater deterrent, he violated the confidence of the consulting-room. It was of no use to alter the law of libel in this matter, as had been suggested, so long as the professional ethics in the case remained as they were. No doctor would violate confidences unless it was laid upon him as a statutory obligation to do so. If it was made necessary for the doctor under penalty to inform the other party to the contract he was sure that the medical profession would accept it, but they would not take such a course of action so long as it remained merely permissive. Mr. Turner also urged administrative action against quacks, one of whom, he said, was well known to be administering salvarsan in London at the present time.

The proceedings closed with a vote of thanks to Lord Sydenham, proposed by the BISHOP OF SOUTHWARK.

ROYAL MEDICAL BENEVOLENT FUND.

At the meetings of the Committee held on May 14th and June 11th thirty-five cases were considered, and £393 voted to the applicants. The following is a summary of some of the cases relieved:

Widow, aged 50, of M.R.C.S.Eng. who died in 1916. Unable to work owing to ill health. Has three children, aged 18 to 14, but none able to help. Income about £100 a year from friends and relations. Rent £36. Voted £10 in two instalments.

Widow, aged 50, of L.R.C.P. Edin. who died in 1891. Was left with three daughters and without means. Only permanent income now £20 a year from the Hospital for Incurables. Relieved nine times, £108. Voted £12 in twelve instalments.

Daughter, aged 62, of L.S.A.Lond. who died in 1874. Only income £25 a year from friends and about £5 from sewing. Pays 4s. 9d. a week rent. Relieved twelve times, £115.

Daughter, aged 48, of M.D.Dubl. who died in 1882. Has suffered for many years from arthritis, and is unable to work. Friends allow £40 a year, and she has £7 10s. from investments. Relieved three times, £12. Voted £5.

Widow, aged 62, of L.R.C.P. and S.Edin. who died in 1913. Endeavours to earn a living by taking boarders. Her son, who used to help, has joined the army, and applicant only receives 9s. 3d. allowance. Relieved once, £10. Voted £12.

Daughter, aged 70, of M.R.C.S.Eng. who died in 1890. Applicant unable to work. Income from other benevolent societies, and other sources, about £50. Has to pay £1 a week for board and lodging. Relieved nineteen times, £204. Voted £12 in twelve instalments.

Widow, aged 44, of L.R.C.P. and S.Irel. who died in 1903. Was left entirely without means, and before the war was able to earn her living by teaching languages. At present urgently in need of assistance. Relieved twice, £22. Voted £10.

Daughter, aged 63, of M.R.C.S.Eng. who died when applicant was a child. Owing to a serious accident in 1916 applicant can only get about with the aid of crutches, and is quite unable to work. Lives with relations who cannot afford to keep her. Relieved four times, £22. Voted £12 in twelve instalments.

Daughter, aged 54, of M.R.C.S.Eng. who died in 1894. Applicant, with two sisters, was left without means. In consequence of ill health not able to earn sufficient to keep themselves. One of the sisters receives help from the Fund. Relieved eight times, £118. Voted £12 in twelve instalments.

Widow, aged 44, of M.R.C.S.Eng. who practised in North Wales and died in 1910. Applicant is left without means, with two children, now aged 12 and 9. Lives rent free in return for services, and has occasional help from friends. Relieved six times, £60. Voted £10 in two instalments.

M.R.C.S.Eng., aged 75, married, who through increasing age and ill health is unable to work; owing to this and the high cost of living and illness of wife, applicant finds he cannot manage with his income of about £100 a year. Relieved once, £18. Voted £26 in twelve instalments.

Widow, aged 68, of M.R.C.S.Eng. who practised at Leighton Buzzard and died in 1904. She lost the whole of her income through fraudulent executors. A niece allows her 11s. a week, which is all she has. Relieved once, £12. Voted £12 in twelve instalments.

Subscriptions may be sent to the Acting Honorary Treasurer, Dr. Samuel West, at 11, Chandos Street, Cavendish Square, London, W.1.

The Royal Medical Benevolent Fund Guild is now called upon, as a result of the war, to deal with many widows and children who, in happier times, would not have thought of asking for assistance. It is glad to receive secondhand clothing and household linen. The class of clothes most wanted is that suitable for boys and girls working in offices, for women, and for old men. The gifts should be sent to the secretary of the Guild, 43, Bolsover Street, W.1.

British Medical Journal.

SATURDAY, JUNE 22ND, 1918.

MEDICAL PRACTITIONERS UNDER THE MILITARY SERVICE ACT.

IN recent issues we have endeavoured to place fully, early, and frankly before the profession the position about the last Military Service Act. We have some evidence, however, that misapprehension exists in some quarters, and this we are disposed to attribute to the flood of words through the eight-lined channel of the statement (M.N.S.R. 61) issued to members of the medical profession last week. There are few epigrams that stick so firmly in every man's memory as that which declares that language was given to us to conceal our thoughts; when a man finds that it takes eight pages of close print to state what the Act means and how the Ministry of National Service proposes to administer it, he begins to ask himself what trap is being hidden behind this cloud of four thousand words. We can confidently assert that the Ministry had no desire to conceal anything, but that it succumbed to the forensic cacoethes by which the younger ministries are so apt to be afflicted.

The Act itself is plain enough; it is a military conscription act. It makes every man born in Great Britain who was not more than 51 on the appointed date, April 18th, 1918, liable to military service, but for medical men it extends the liability to 56. In both cases the person concerned must be found physically fit on medical examination, and in both cases the Ministry of National Service may intimate to him that he can be more usefully employed for the good of the nation in carrying on his occupation in a civilian capacity. The Ministry has the power under the Act and Regulations to tell him where he can most usefully carry on his occupation during the currency of the Act, and if he refuses without good cause he may be drafted into the ranks of the army to serve in any capacity the army may think fit, and it is improbable that the recalcitrant conscript will be employed by the military authorities at his own work. When he receives notification from the Ministry of National Service that his case is under consideration, which cannot be until after he has been medically examined, the person affected may apply to the appropriate tribunal for a certificate of exemption on two grounds: He may apply on personal grounds—that he would suffer serious domestic or financial hardship, or that he is ill or infirm, or that he has a conscientious objection to undertaking combatant service. On the other hand, he may apply on the ground that it is expedient in the national interests that, instead of being employed in military service, he should go on doing the work he is doing. Or he may apply both on personal and occupational grounds. His right to apply for a certificate of exemption is indefeasible. If the application is made within the limit of time—fourteen days—after the notification is sent to him by the Director-General of National Service, the

tribunal must hear his appeal, unless, with the assent of the Director-General, it decides to grant exemption in accordance with the application without hearing the case. At the hearing the applicant may call evidence, and he may have the assistance of a friend, and there is nothing to prevent this friend being a lawyer. This would open up an endless vista of hearings before the tribunals—in the case of medical men before the tribunals constituted by the Central Medical War Committee and the Scottish Medical Service Emergency Committee, or before the Committee of Reference—were it not that the medical tribunals have power on occupational grounds to grant only conditional certificates of exemption from military service. The condition attached to the certificate will be that the practitioner, if not required for medical service with the armed forces, "shall undertake such professional service, and under such conditions, as the Director-General of National Service may, after consultation with the Medical Tribunal and in concert with any Government Department concerned, from time to time deem best in the national interests."

The documents issued by the Ministry of National Service do not seem to carry us further than this. The actual procedure in the case of medical men in England and Wales has been set out in the circular letter addressed by the Central Medical War Committee to Local Medical War Committees. Full particulars were given last week (p. 674). The Committee will first ascertain the areas from which doctors should be spared, either for commissioned service with the forces or for substitution in civilian practice, if and when required. A notification will then be sent to medical men in the areas selected, who will previously have been examined medically by special National Service medical boards; the notification will be accompanied by an intimation that they may exercise their statutory right to apply for exemption; with the notification will go also a "certificate of protection" issued by the Director-General of National Service. This certificate appears to owe its name to the fact that it renders its possessor immune to the attentions of the recruiting officer. The certificates will be issued to medical practitioners by the Ministry of National Service area by area, and a general instruction has been given to recruiting officers not to call up medical practitioners for service pending the issue of the protection certificate. The phrases "protection certificate" and "protection" are defined generally in the recruiting code of the Ministry of National Service. These expressions are held to relate to "cases in which it is desired to secure for the time being the retention in civil life of men who are liable to and available for military service; and in order to secure this object administrative directions are given that such men are not for the time being to be called up for service. In order that the men concerned may be in a position to establish that they are rightfully continuing in civil life, certificates are issued by the authority of the Minister of National Service, recording the fact that the holder is not to be called up for service while the certificate remains in force."

The "certificate of protection," if accepted, will have the same effect as a certificate of so-called "standard exemption" granted by the medical tribunal. This standard exemption is conditional. It will hold good until the practitioner is offered a commission, but it is meanwhile subject to the condition that if required he will undertake such professional work as the Director-General of National Service, after consultation with

the medical tribunal, may offer him. Thus the hearing of an application on occupational grounds can result only in the issue of a certificate of exemption subject to the same condition as that attached to the "certificate of protection." Acting on information supplied by the Local Medical War Committee, the Central Committee will have ascertained the names of all medical men in an area who are available for commissions or for civil medical work other than in their own practices. From these practitioners the local committee will select those who they think can be most easily spared; but those so selected, if not satisfied with the recommendation of the local committee or the provisional decision of the central committee arrived at without a hearing, have the guarantee of the central professional committee to a hearing at which all relevant circumstances will be taken into consideration, as, for instance, personal difficulties, and any claim for retention at home as compared with the claims of other practitioners liable under the Act. The hearing in these circumstances will take place before the central professional committee acting as an advisory body to the Ministry and not as a statutory tribunal. A statutory hearing in accordance with the regulations can only be held should the practitioner refuse the "certificate of protection" and make formal application to the tribunal for exemption within fourteen days after receiving notice from the Ministry. The point for each practitioner to decide is whether he will gain any practical advantage by refusing the "certificate of protection" and making an application to the tribunal for exemption. As to his legal right to do so there can be no doubt.

It is hoped that the method of procedure worked out by the Central Medical War Committee, in consultation with the medical department of the Ministry of National Service, will result in providing, with the least amount of inconvenience to the profession, a reserve of doctors known to be available either for military or civilian work; this reserve will be drawn upon if and when required. But the Ministry of National Service has stated that the probability is that most of the practitioners made liable under the new Military Service Act will in fact never be required to do anything but their own professional work in their own locality, and that where substitution is necessary the arrangements would in the majority of cases be local only, and would not entail the removal of the substitute from his own practice.

Before dismissing the subject we are bound to add one observation, which is that the reason alleged for the special provision as to medical men contained in the last Military Service Act is primarily the needs of the military forces. We must assume that the Ministry of National Service has satisfied itself that the army cannot practise greater economy in its use of medical officers already serving. Much of the information which reaches us is to the effect that though certain economies have been practised there is still great room for more, especially at home. It is not possible for us to establish the truth of these views, partly because the mouths of witnesses are closed; but it is, we think, greatly to be regretted that the report of the special committee which went to France last September has not been published and that a similar committee was not appointed to investigate the position of affairs in this country. We believe that the War Office has itself instituted such an inquiry, but any action which may have been taken in consequence has not been made public.

THE PATHOLOGY OF EARLY CARDIAC BREATHLESSNESS.

IN an article under this title we published in April, 1917, p. 459, an account of a report then recently published by the Medical Research Committee upon soldiers returned as suffering from disordered action of the heart (D.A.H.) or valvular disease of the heart (V.D.H.). These men are sent to hospital during training or on active service because they complain of breathlessness, fatigue, palpitation, precordial pain, and giddiness, or actual fainting, experienced for the most part during or after exertion. In order to avoid any implication not justified by the present state of knowledge, Dr. Thomas Lewis suggested the term "effort syndrome" for this group of symptoms arising under the condition mentioned. The group is to be found in a variety of pathological states—for example, in heart disease, in early phthisis, and in exophthalmic goitre—but it is also found, and with much greater frequency, among soldiers who present no physical signs of structural change of the heart tissue. The Medical Research Committee has now printed a supplementary report by Dr. Thomas Lewis, founded on a comparison of a number of patients of whom some had valvular affections and some had not, but all presenting the "effort syndrome." Persistent and incapacitating symptoms of cardiac disease, accompanied by valvular lesions, are usually recognized during the period of training, and the man is discharged from the army as permanently unfit. The cases of valvular disease considered in the report include, therefore, only minor degrees which have not incapacitated the men during training, or, at any rate for some time, under actual service conditions. Subject to the qualification indicated, it is said that, speaking generally, the physical disability in non-valvular cases is not appreciably less than the disability produced by the early phases of grave structural damage of the heart.

The etiological factors which underlie the symptoms comprising the "effort syndrome" are found to be similar whether the soldiers belong to the valvular or non-valvular group. In the earlier report stress was laid upon the frequency with which non-valvular cases gave a history of having suffered from infections of various kinds, and it was estimated that infectious disease played a chief part in promoting the condition in at least 50 to 60 per cent. of patients in whom the "effort syndrome" was not combined with clear signs of structural disease. In the new report comparison is made in this respect between three groups of men—101 cases of valvular disease of the heart, 558 non-valvular cases, and 100 cases of men invalidated for gunshot wounds who did not present any symptoms of cardiac disorder. Any infection which had kept the subject in bed for more than two or three days was reckoned as an illness, and quinsy and repeated or severe tonsillitis were included. Any uncomplicated exanthema before the age of ten years was not reckoned. Among the 100 wounded men 82 had suffered from no serious illnesses; the 18 who had so suffered had had 32 illnesses among them. Amongst the 558 men belonging to the non-valvular group 459, or 82 per cent., had experienced serious illnesses, or such accidents as shell shock, gassing, and wounds. These men were returned to hospital for breathlessness, fatigue, palpitation, and so on, and often assigned the wound, gassing, or shock as a primary or aggravating cause of the symptoms. Amongst the 101 valvular cases 90 gave a past history of serious illness, and in 11 only was there no such history. The incidence of infectious disease and accidents, though higher in the valvular than the non-valvular

cases, was extremely high for both. The most notable difference was with respect to rheumatic fever. There was a history of rheumatic fever or chorea in 61 per cent. of the valvular cases, and in only 23 per cent. of the non-valvular cases. Among the wounded men taken for comparison only 4 per cent. gave a history of rheumatic fever or chorea. The evidence does not indicate that army life is chiefly responsible for the high incidence of a rheumatic history among the patients suffering from valvular disease. When the patients were subdivided into three groups—according as the symptoms first appeared before joining the service, during training, or on active service—the percentage incidence was found to be heaviest in the first group, and least in the last group. This distribution, it is considered, may be explained, in part at least, by the relative frequency of rheumatic causation among the young and by its relative infrequency as age advances.

In the earlier report it was stated that a history of venereal disease was rare among the valvular cases: it was obtained in only 2 per cent. It is concluded that venereal disease plays little or no part in the production of the "effort syndrome." It is not established that a history of venereal disease is much rarer in these men than in soldiers as a body; amongst the 100 men suffering from gunshot wounds a venereal history was obtained in five only, and in four only of 101 cases of grave valvular disease. While it is recognized that these figures may not represent the total incidence of venereal disease, since the man may wish to conceal the circumstance, it is believed that the incidence is comparatively small, and that the prevalence of syphilitic affections among the new armies has been exaggerated in many quarters. Among the aortic cases admitted during 1916, in which year the statistics were obtained, syphilis played but a small part, for precisely the same reason that rheumatic fever played a large part—namely, because of the youthfulness of the soldiers: but it is added that another and important reason is the morality of the men. Of the purely aortic cases, 29 were subjected to the complement fixation test; in 16 there was no rheumatic history, and the complement tests were all negative. Of the remaining 13, who all gave a rheumatic history, only one gave a positive complement test. A positive reaction was obtained in two of the 13 cases of aortic disease associated with mitral stenosis. Syphilis was suspected to be a causal agent in only four of the whole series of 50 aortic cases, and three of these four were over 40 years old, and in all three the symptoms dated to a period before joining the army.

Summarizing the effect of infection, it is said that in cases of valvular disease the onset, when marked by a special event, dated most frequently from rheumatic fever. Rheumatic fever also headed the list in non-valvular cases, although various other incidents taken together were a good deal more frequent. The symptoms came on gradually without special incident in 41 per cent. of the non-valvular, and in 52 per cent. of the valvular cases. With regard to the possible operation of gassing or shell shock as a cause, the facts are not conclusive; such incidents were given as a starting point in a small proportion of cases (2 to 3 per cent.), both among valvular and non-valvular cases. The most probable conclusion seems to be that the gassing or shell shock aggravated the effects of a lesion which previously did not produce symptoms, or symptoms so slight that they passed unheeded. The evidence as to the consumption of alcohol does not favour the view that it has anything to do with the production

of the "effort syndrome"; so far as the figures go, they would rather point to the greater frequency of both non-valvular and valvular disease among teetotalers, but few of the men admitted consuming more than a moderate amount of alcohol. As to tobacco, both the non-valvular and the valvular cases smoked less than the men suffering from gunshot wounds taken for purposes of comparison. It is suggested that one reason for the smaller consumption in the medical groups is that the patient learns that tobacco has an injurious effect upon the symptoms. Many of the men smoked little because they found that more upset them.

The concluding part of Dr. Lewis's report raises questions of very wide import. He points out that the etiological factors underlying those symptoms which comprise the "effort syndrome" are similar, whether the soldiers belong to the valvular or non-valvular group. The chief difference in the clinical histories is the higher incidence of rheumatic fever in the first group. This fact and the high incidence of infectious disease in the histories of both groups is suggestive. It is pointed out that if patients in whom the heart is seriously damaged present symptoms which are not to be distinguished from the symptoms of other patients in whom there is every reason to believe the heart to be sound, and if the symptoms in both groups follow or are aggravated by similar events, then the symptoms in the former must not be ascribed to deficiencies in the circulation, and in the latter to some different cause. If the symptoms in valvular cases are assumed to be due to deficient circulation, are they due to the same cause in non-valvular? This question is answered in the negative, for it has not been possible to detect signs of circulatory embarrassment.

The question then arises whether in the valvular cases the symptoms have an origin other than improper distribution of the blood. Breathlessness on exertion, which is the cardinal symptom, can be discussed upon a chemical basis. In the non-valvular cases the breathlessness may be due not to imperfect circulation, but to altered chemistry of the blood—namely, to a "buffer-salt" deficiency. The theory of "buffer" salts is explained in a report to the Medical Research Committee published in the JOURNAL some time ago.¹ The blood is at all times receiving and parting with acid and alkali. These variations, if effected in an ordinary saline solution, would produce changes in relative acidity and alkalinity which would be physiologically intolerable. A given addition of carbonic acid to the blood only produces a quarter of the change in reaction which it would produce in a corresponding quantity of physiological saline solution. The reason is that the blood contains such substances as sodium bicarbonate, monacid and diacid sodium phosphates, and protein, which tend partly to fix the acid so that in a sense it loses its chemical freedom. The salts mentioned are therefore called "buffer" salts because they ease the shock to the reaction of the fluid caused by the addition of acid or alkali. In early mitral stenosis deficiency of the circulation has been assumed, but has never been proved to exist. There is no question that deficient oxygenation of the blood plays a part in the late stages of mitral stenosis, when there are signs of venous stasis, or obvious failure of the heart muscle, but this does not apply to those early cases of mitral stenosis which exhibit breathlessness on exertion. Mr. Barcroft has tested three such cases and

¹ Breathlessness in Soldiers Suffering from Irritable Heart. By Lewis, Barcroft, Cotton, Dufton, Milroy, and Parsons, BRITISH MEDICAL JOURNAL, 1916, vol. ii, p. 517.

finds a deficiency of buffer salts. The conclusion from this would be that an altered chemistry of the blood may be, and often is, responsible for breathlessness in early mitral stenosis, and that in such cases it is a sufficient explanation. If these observations are confirmed, the resemblance between the histories and symptoms of the two groups of cases will become less difficult to comprehend. They may be regarded as essentially similar, though in the one, as a result of a higher incidence of rheumatic fever, damage to the heart is the rule. In the non-valvular cases the condition may be regarded as uncomplicated, in the others as complicated by structural disease. Finally, it is said that there is no reason for a belief that the causes of the several conditions, other than those which are purely aggravatory—that is to say, those which lay bare the latent weaknesses—differ materially amongst civilian and military populations.

THE WORK OF NATIONAL SERVICE MEDICAL BOARDS.

Those, probably a decreasing number, who follow questions in the House of Commons will have observed the remarkable interest shown by a certain knot of members in the medical examination of the older men affected by the new Military Service Act. It has led to a number of attacks on the Ministry of National Service which have taken the form of attempts to blacken the character of the members of the National Service Medical Boards now set up all over the country. Normally such a board consists of a chairman and four medical practitioners engaged in general or consulting practice in the locality. In a time of pressure such as the present it has often been necessary to reduce the number to three. The duty of the medical boards is to put each man in one of four grades; its decision is based solely upon medical considerations. The decision as to the indispensability or otherwise of men in different classes of the community for different classes of work is a matter for the tribunals. These bodies have pressed for a more detailed medical grading of men, for if the grades were multiplied it would in many cases be easier for the tribunals to determine whether a man of a certain grade was more necessary for civilian than for military duties. It was, however, clear that such multiple grading could not be made on medical grounds solely; it would necessarily be complicated with the problem of the man's fitness or indispensability for civilian or military work, as the case might be—a matter for the tribunals themselves. The matter of the grading of men of older years was carefully considered by the Medical Department of the Ministry of National Service before the new Act came into force. Two courses were open to it, either to devise a new system of grading for the men of older years, or to apply the system already in use to them. The reasons which were felt to militate against the first alternative were that it would not be easy to decide at what age any system of older grading should commence, for to establish the lower limit at the age of 43 would have afforded no firm foundation either on medical reasons or on grounds of efficiency for military or civilian work. The ages between 43 and 51, or in the case of medical practitioners 56 years, could not be made equivalent to any age periods related to military efficiency on the one hand, or to physical life changes on the other. Again, it was realized that it would be extremely difficult to work out conditions to determine grading for the older men which could be dealt with on lines parallel with those determining the grading of younger men. The Medical Department of the Ministry consulted the medical authorities who had previously assisted in drawing up the system of grading, and the opinion was expressed clearly and firmly that it would not be possible to establish different systems of grading for men of different ages,

as no scientific or medical basis could be found. Medical boards were accordingly instructed to place the older men in Grade I if they possessed the full normal physical fitness to be expected of their age. Those who varied from this normal standard in certain particulars were to be placed in Grades II or III, while those totally or permanently unfit for any form of service would be placed in Grade IV. Among the older men are some fit for certain classes of military work, and the army has given an undertaking that they shall be trained and employed according to the ability and efficiency to be expected of their years. The task which the Medical Department of the Ministry of National Service has had to undertake was quite novel in the history of this country. Continental military powers had already their older armies—Landwehr and Landsturm—established out of their younger army. The work now imposed upon the medical boards of selecting from the older men of the country those suitable to form the various classes of the new older army is of a most responsible character. A large proportion of civilian medical practitioners are giving their services to the country for this work on the invitation of the Government, and the patriotic purpose underlying their effort should be understood and recognized. They should be immune from captious criticism, and such incidents as that provoked by Sir Frederick Banbury on Tuesday ought not to be allowed to waste the time of the House of Commons and the time of officials, which is, perhaps, of more value. The story Sir Frederick Banbury had to tell is set out with sufficient detail in our Parliamentary Notes. Sir Frederick Banbury relied upon an *ex parte* statement, which gave an altogether erroneous impression of what actually happened. The gentleman of whom the story is told was a haemophiliac, and produced a certificate from his ordinary medical attendant to this effect. Evidence of the existence of the condition indicated in the certificate was at once recognized and the gentleman was within a few minutes placed in Grade III, which includes those who, presenting physical disabilities which unfit them to undergo military training, may be called upon to perform duty in military establishments under conditions approximating to their home life and surroundings. The letter Sir Frederick Banbury read out to the House of Commons contained a paragraph to the effect that the medical board disbelieved the statement that the gentleman was a haemophiliac, and made him get into a bath to try and bend his knees by swimming. After reading this out Sir Frederick Banbury said: "I do not think I have ever made a statement [to the House] that I have not verified, or perhaps only in one instance." We are afraid that the member for the City of London will have to add one more. The examination, it is true, was made at the Camberwell Baths, but the bath was boarded over a year or two ago and forms a large hall, which has since been in use for the medical examination of recruits. This gives a measure of the care taken to verify statements made to the House of Commons—*ex pede Herculem*.

INTER-ALLIED SCIENTIFIC FOOD COMMISSION.

LAST week we gave some account of the work of the Inter-Allied Scientific Food Commission, and mentioned that it was holding its third meeting in London. This meeting, which has now been brought to a close, was chiefly concerned in examining the figures which would render it possible to determine the calorie value of the home production of each of the allied countries, and then, by comparing the figure thus obtained with the needs in calories of the population in each country, to determine the amount of imports necessary for the maintenance of the population, or the exportable surplus, as the case might be. The Commission completed this task during the London meeting, and its results, which will shortly be presented to the allied Governments, will serve

as a basis for the action to be taken by the different inter-allied executives in allocating to each country its proper proportion of the supplies of food which will be available for export from the American continent and from such other parts of the world as shipping facilities may allow. The Commission has thus performed for all the allied countries a work somewhat similar to that carried out by the Food (War) Committee of the Royal Society for the United Kingdom. For the first time it will be possible for the inter-allied pooling of resources and supplies to be carried out equitably in accordance with the impartial decisions of science.

SODIUM CYANIDE A RESPIRATORY STIMULANT. Though praised as a respiratory stimulant ninety years ago by Michael Ryan, hydrocyanic acid has long lost any reputation in this respect, but the experimental and clinical results obtained by Loevenhart, Lorenz, Martin, and Malone¹ from the intravenous injection of pure sodium cyanide, which has the same action as the acid, show that its use should be revived. A freshly prepared solution of pure sodium cyanide in sterile physiological salt solution was given intravenously to dogs with respiratory depression due to morphine, chloroform, and ether narcosis, and especially in artificially increased intracranial pressure; sixty-two experiments were carried out in connexion with the last condition. The sodium cyanide was preferred to the potassium salt on account of the depressing effect of the latter on the heart. In increased intracranial pressure, such as occurs in man from tumour, haemorrhage, and fracture of the base, sodium cyanide is the most powerful respiratory stimulant known. After a single injection there is a latent period of a few seconds, and then the respiration is stimulated for ten to fifteen seconds. A slow continuous intravenous injection will ensure a continuous stimulation of respiration. After animal experiments had shown the safe limits of intravenous injection, ten cases were treated by injection of a fiftieth normal sodium cyanide solution (0.1 per cent.) into the median basilic vein with a 20 c.cm. Record syringe. The cases selected were examples of increased intracranial pressure from any cause with respiratory depression, and the injections were given not instead of a decompression, but pending operation; in respiratory failure due to chloroform or ether, and in bed-ridden cases of advanced paresis with developing hypostatic pneumonia the drug proved in every instance a reliable stimulant, and the results in animals were fully confirmed. After a latent period of twenty seconds respiration was stimulated by a single injection for a period rarely exceeding thirty seconds. Slow continuous injections are more conveniently given by means of a burette, the fluid being run in at a rate of 1 c.cm. in fifteen to thirty seconds; one patient received over 100 c.cm. in sixty-four minutes. The cyanide is apparently transformed rapidly in the body into a non-toxic product, but the injection should be slowed or temporarily stopped on the appearance of any untoward symptoms such as well-marked pallor, nausea, much increase in pulse-rate, or depression of respiration from too rapid injection or from an excessive amount. As a matter of fact, no bad symptoms were observed in any of the patients, and many of them were obviously benefited. The method is suggested also for resuscitation from drowning, but no case was available for trial.

ANTIVIVISECTIONISTS AND THE RED CROSS.

WHILE crediting the opponents of animal experimentation with honesty of purpose, it can scarcely be denied that the effect of this good quality is neutralized by an obliquity of moral vision which makes them in the literal sense *hostes humani generis*. While the philo zoist loves animals by nature, he suffers his fellow man, as Miss Frances Power Cebbe said of herself, only by grace. His fanaticism leads

him much farther, for he is willing to sacrifice the welfare of mankind to the comfort of certain animals. A particularly shocking example of this perversity of mind has recently been seen in America, where, owing to the action of antivivisectionists, the Red Cross was induced to revoke its decision to appropriate money for animal research work in the interest of sick and wounded soldiers. Advice plainly intended to discourage enlistment and efforts made to safeguard the health of the troops was widely disseminated. The impudent statement was made that, "although it (vivisection) has been practised for many years, nothing has been discovered by means of it that is at all beneficial to the human race." In face of what has been accomplished in the present war for the treatment and prevention of wound infection, tetanus, gas gangrene, trench fever, shell shock, and other conditions, we can only wonder at the mental blindness which prejudice can produce in otherwise intelligent persons. We have credited antivivisectionists in general with honesty of purpose, as we believe that their opposition to medical research is due to ignorance. But it is difficult to acquit some of their leaders of deliberate bad faith when we read certain statements made in a pamphlet entitled "Why is my Soldier Sick?" issued by the National Antivivisection Federation of New York, and forwarded to the United States Secretary of State for War. In protesting against the compulsory inoculation of soldiers, it is asserted that Great Britain had been forced to rescind the enactment of compulsion after the alarming effects of inoculation were disclosed. Professor W. W. Keen of Philadelphia, *clarum et venerabile nomen* of American surgery, who, though over 80, is serving as a major in the Medical Reserve Corps, has come forward, not for the first time, as a champion of experimental research, the beneficial effects of which he has seen in his long career, extending from the Civil War to the present day. He refutes the allegation that this country was obliged to rescind compulsion by showing that it has never existed. Antityphoid inoculation has never been compulsory in the British army. Nevertheless, in spite of the persistent misrepresentation of antivivisectionists, 99 per cent. of our troops have voluntarily submitted to vaccination against typhoid fever. In an article published in *Science* of February 22nd, 1918, Dr. Keen showed by a mass of facts, which must carry conviction to every unbiassed mind, how great is the measure of protection against typhoid afforded by inoculation in the American and British armies, and the immense progress in the art of healing which has been the outcome of animal experimentation. On the other hand, the antivivisectionists have done nothing whatever for the benefit of man or even of animals.

FOOD, HOUSING, AND TUBERCULOSIS IN GERMANY.

THE Prussian Food Department issued an order on November 9th, 1917, permitting a considerable increase of the food ration for the subjects of pulmonary disease, both in institutions and at home. The order states that for some months the 1913 mortality from tuberculosis has been exceeded by 50 per cent. This is attributed to lack of food, particularly in the case of patients living at home. Special efforts are therefore to be made to bring the ration for these patients up to that obtainable in institutions for the tuberculous. The revised weekly ration is: Potatoes, 5 kilos; meat, 500 grams; bread, 2 kilos; butter, at least 250 grams; and 4 eggs. To this is to be added a monthly ration of 400 grams of cheese, 2,000 grams of cereals and leguminous foods, and 1,000 grams of marmalade, artificial honey, etc., together with 1 litre of milk a day. These are minimum quantities. There is no reference in the scheme to sugar as such. The need for giving the tuberculous sufficient food is considered so urgent that, failing other means, the ration for the tuberculous is to be brought up to the desired

¹ A. S. Loevenhart, W. F. Lorenz, H. G. Martin, and J. Y. Malone, *Arch. Int. Med.*, Chicago, 1918, xxi, 109-129.

level at the cost of the healthy in the same district. The *Allgemeine Ortskrankenkasse* of Berlin has investigated the housing conditions of 9,933 of its sick members. Over 1,300 lived in rooms with a floor surface of less than 10 square metres, and 25 per cent. of them shared these rooms with one or more other persons. The cubic capacity was in the case of 3,400 persons under 20 cubic metres a head and in that of 263 persons under 10. Of the 3,542 patients with lung disease only 715 had bedrooms to themselves; 21.46 per cent. of the men and 28.94 per cent. of the women had relatives who had died of, or were suffering from, pulmonary tuberculosis. Of the 2,830 married women suffering from pulmonary tuberculosis 94 had lost their husbands from tuberculosis, and of the 946 married men 7 had lost their wives from this disease.

MILITARY HEART HOSPITALS.

WE refer elsewhere to a report by Dr. Thomas Lewis setting out some of the conclusions which have been reached as the result of the intensive study of heart disorders occurring among soldiers at the central heart hospital, established first at Hampstead, but afterwards removed to Colchester. Active steps are now being taken to extend this organized work to all the other Commands, and the intention is to establish a hospital on the same lines as that now at Colchester in each. The results reached at the inquiry instituted at the instance of the Medical Research Committee, so far as it has yet gone, are of the utmost importance, not only at the present time in their military relations, but also as a permanent contribution to cardiac pathology generally. We have often had occasion to admire the readiness with which American medical men, both before their country entered into the war and, naturally, with even greater eagerness since, have taken advantage of every opportunity to make themselves acquainted with what has been done by their European allies. Such opportunities have, of course, been readily afforded, and this matter of heart disorders in soldiers is no exception. The American military authorities have been for some time systematically sending men to work in the hospitals directed by Dr. Lewis, with a view to organizing similar work for the American armies.

DR. ALFRED COX, O.B.E.

THE inclusion of Dr. Alfred Cox's name among the Birthday Honours announced in the *JOURNAL* last week has been observed with warm approval by all medical men and women to whom he is known personally, or through his unremitting public services as Medical Secretary of the British Medical Association, and co-secretary of the Central Medical War Committee. This general feeling was expressed by the Stratford Division of the British Medical Association, which at a meeting on June 12th passed a unanimous resolution congratulating Dr. Cox upon his appointment as an Officer of the Order of the British Empire.

THE splendid response made by the students of Trinity College, Dublin, to the call of duty is well illustrated by the great diminution in the number of students on the college books shown for each year in the second volume of the *Calendar*. Since the war began the number of men students has fallen steadily. In the year 1913-14 there were 1,074 men students on the books, this term there are only 576, including many South Africans and others who have already served in the war. The number would be still lower but for the fact that the Royal Navy and the War Office have sent back a number of medical students to complete their medical course. The number of women students has remained nearly constant in spite of larger entries. This has been brought about by the fact that many women students have temporarily given up their studies to undertake war work. At the moment there are 192 women on the college books. Of the total number of students on the books a very large proportion are in the medical school.

Medical Notes in Parliament.

Pay of Territorial Medical Officers.

COMMANDER BELLAIRS asked Mr. Forster on June 18th (1) whether the Army Council had refused the request of the British Medical Association that the position of the officers of the Royal Army Medical Corps who patriotically came forward before the war as Territorial and Special Reserve officers should, in regard to pay, allowances, and gratuities, be brought to the same level as that of the Temporary Commissioned contract officers by an increase in the gratuities to which they were entitled on demobilization; (2) if he would say on what grounds the Government negatived the recommendation of the Departmental Committee of 1917 that officers of the Royal Army Medical Corps, Territorial Force, and Special Reserve, who joined before the war, should be put on a level with temporarily commissioned contract officers as regards pay, allowances, and gratuities, where they would gain thereby; and whether he was aware that dissatisfaction was felt by the junior medical officers of the Territorial Force and Special Reserve at the refusal of the Government to remove this injustice. Mr. Forster said he had nothing to add to his previous replies. The British Medical Association brought forward no considerations that were not fully appreciated by the Cabinet Committee which decided this question.

Commander Bellairs asked what criterion the War Office adopted in this matter. Did it not consider that those who joined first should be treated at least as well as those who joined last? Mr. Forster said that with these officers, as with others, it was partly a matter of the terms of contract of service.

Examinations by National Service Medical Boards.

IN reply to Mr. P. A. Harris, Mr. Beck, Parliamentary Secretary, Ministry of National Service, said on June 13th that certain complaints of cursory and inadequate examinations by National Service Medical Boards had been made. They were comparatively few, and on investigation had generally proved not to be well founded. Under the sectional method of examination adequate time must be devoted to the examination of each man. Great care was exercised under instructions issued by the Ministry to take into consideration any information given to the board, either in the form of medical certificates or verbally by the men themselves. Moreover, any man who was dissatisfied had a right to lodge an application with the Appeal Tribunal for examination by medical assessors appointed by the Local Government Board. Mr. Beck added, in answer to Mr. Harcourt, that most explicit instructions were issued that certificates of private practitioners should be taken into account. In every medical board room he had seen there had been a notice posted asking men to produce any medical certificates that they had brought with them. On further questions by Mr. Morel, Mr. Beck said the instructions issued to the boards were most elaborate and were published.

Reduced Membership of Medical Boards.

IN a written answer to Sir Herbert Nield, who asked whether any of the provincial boards had been reduced from five to three members and under what authority this change had been effected, Mr. Beck stated that the information was not available, and could be obtained only by asking for daily returns, which would seriously increase the work of the already over-worked boards. The normal National Service Medical Board consisted of five doctors, but in times of pressure these might be reduced to three. This course was quite unavoidable owing to the serious shortage of doctors. Sir H. Nield also asked whether any, and, if so, how many, members of the medical board had resigned since November 1st, 1917; in how many cases such resignations were due to alleged differences of opinion between the members of medical boards and the president of the board, owing to his action in disregarding the opinions of members of the board and placing men in a higher grade than that in which the members thought the man should be placed; what proportion of men so examined were personally examined by the president; and what opportunities were afforded other members of the board for further examination or for discussion before the grade was determined by them. Mr. Beck replied that out of some 2,500 doctors serving as members of medical boards sixteen had resigned since November, 1917. So far as he was aware, none had resigned on the grounds suggested. In reply to another question by Sir H. Nield, he said that the National Service Medical Boards at Conduit Street, which had been specially dealing with men coming under the extended age limits, had, during this temporary high pressure, necessarily been composed of three members, and it had not been practical as yet to increase that number. With regard to the other boards in the London region he should require to have detailed inquiries made, as the composition of the boards had varied with the pressure of recruits attending for examination, and the number of doctors available for service on the panel. Mr. Beck stated, on June 19th, that of the men of the

new military age examined at Conduit Street down to June 15th the percentage passed in Grade I was 29.1.

Examinations of Older Men.

In reply to Sir Francis Lowe, on June 18th, the Minister of National Service said that there had been no change in the standards of medical fitness required for classification in Grade I and II. When introduced in October last, the term "Grade I" was defined as meaning men "who attain the normal standard of health and strength and are capable of enduring physical exertion suitable to their age." This definition had never been varied. Current statistics covering large numbers of examinations showed that there is no increase in the proportion of men placed in Grades I and II. There was no difference in principle in the grading of men above and below 45 years of age.

Sir F. Lowe asked whether some definite action would not be taken to counteract the alteration of policy which was undoubtedly taking place in the tribunals all over the country. Sir A. Geddes replied that there had been no alteration of policy in the Government department concerned. There had been announced by certain chairmen of tribunals and appeal tribunals a change in policy in their action, but that had nothing whatever to do with the Ministry of National Service. The number of complaints received was extraordinarily small, less than 1 per cent. among the last 1,250,000 examinations by National Service Medical Boards.

Sir Francis Lowe next asked if the Chairman of the House of Commons Tribunal had not expressed very strong views on this matter. Sir A. Geddes replied that he could only believe that the chairman of that tribunal did not know the meaning of Grade I when he made the statement. In answer to Mr. Snowden Sir Auckland explained that from the last one million and a quarter men examined they had received 11,441 protests of one sort or another; that number included appeals. Of the total number of appeals against medical examinations, 7,800 had already been dealt with by the appeal tribunal, and 4,266 cases dealt with by the tribunals had been allowed to go forward to the assessors; in 3,679 cases permission to go to the assessors had been refused by the tribunals. He could not say whether all these 11,000 cases occurred subsequent to the last Military Service Act.

In reply to a question by Mr. Hogg, Sir Auckland said the Chairman of the House of Commons Tribunal had stated, according to the press reports, that all Grade I men of the new military age were to be regarded by him as being Grade II. In view of the fact that Grade I was defined as meaning "a man who attains the normal standard of health and strength and is capable of enduring physical exertion suitable to his age," that statement of the Chairman of the House of Commons Appeal Tribunal could have no meaning.

Examination of Haemophiliac.

At the close of the debate on June 13th on the vote of credit, Sir Frederick Banbury read a long letter from the cousin of a solicitor in the City of London, aged 43, who was a haemophiliac, and belonged to a family known to be subject to that disorder. The gentleman when examined at Camberwell on May 31st produced a statement from his ordinary medical attendant and also from a specialist. It was alleged that he was nevertheless put through certain exercises and made to bend his knees, and that he shortly afterwards suffered from pulmonary haemorrhage, which endangered his life. He was put in Grade III. Sir Frederick Banbury added that though it might be untrue that the doctors had received private instructions to pass everybody that they possibly could, there was a strong feeling that something of the sort had been done. Sir Auckland Geddes, in his reply, said that there were no instructions that every man should be passed in some grade or to do some service. He had made it his business since the allegation had been made to search not only at head quarters, but in twenty-four places where examinations were going on; there were no secret instructions in the ordinary sense, and he could find no trace of such instructions existing. With regard to the case at Camberwell, he said he had made inquiries of the three doctors concerned, who stated that the gentleman referred to was not put through the ordinary routine examination. The certificate he presented to the board showing that he was suffering from haemophilia was received and accepted. The gentleman was asked to bend his knees, but when he explained that he could not the request was not persisted in. Sir Auckland Geddes thought that the bleeding from the lung might have been brought about by the excitement of the examination or the exertion involved in going to be examined, and added that he would investigate this particular case further.

Duties of the Inspector of Medical Services.—Mr. Alden asked Mr. Macpherson, on June 17th, whether Sir William Babbie had been appointed Medical Adviser to the Adjutant-General, and, if so, whether, having regard to the findings of the Mesopotamian Commission, he would consider the advisability of placing some other medical man in this position. Mr. Macpherson replied: Sir William Babbie, V.C., has not been appointed Medical Adviser to the Adjutant-General. At present he is Inspector of Medical Services for such duties as he may from time to time be directed to carry out. He is an officer of wide experience, and has an intimate knowledge of everything connected with the medical services of the army. On account of the reference to Sir William Babbie in connexion with the inquiry of the Mesopotamian Commission, his case was referred

to the Army Council, which, after full consideration of all the facts, decided that the explanation he had been called upon to offer was satisfactory in all respects, and that his services should not be lost to the army. Sir H. Craik: Is it not the case that the findings of the Mesopotamian Commission threw no personal aspersion whatever on Sir William Babbie? Mr. Macpherson: Not only is that so, but they recommended in so many words that he should be re-employed.

Medical Cases in Training under Pensions Department.—Mr. Hojce, in reply to Mr. Anderson on June 12th, said that the number of medical cases receiving training in the week ended June 5th, 1918, and the number which had received training under the Ministry up to that date, were 6,526 and 7,613 respectively, or a total of 14,139, made up thus:

	Under Training.	Trained.
General subjects (Institutions and Workshops)	4,477	2,722
Blind (St. Dunstan's)	551	422
Lord Roberts Memorial Workshops	755	1,385
Munition work	733	3,084
	6,526	7,613
Total	14,139	

In practically every case men who had completed courses of training had been put in employment.

Midwives Bill.—The Midwives Bill, Introduced in the House of Lords by the Lord President of the Council on June 13th, is designed to bring the English law into line with the Acts passed for Scotland in 1915 and for Ireland this year. These Acts were based on the Midwives Act of 1902, with amendments suggested by experience. Most of these changes and additions were included in the recommendations of the Midwives Act Committee of 1909.

Cheadle Board of Guardians: Medical Officers.—Sir Watson Cheyne asked Mr. Hayes Fisher, on June 17th, whether the recent appointment by the Cheadle Board of Guardians and District Council of a whole-time medical officer to take the place of six part-time medical officers in a district of 54,000 acres and 26,000 inhabitants, was strongly disapproved locally both by the public and by the medical profession; whether, as had been represented to the Local Government Board, it would be impossible for one man to carry out the duties efficiently, and the interests of the sick poor in the area would suffer seriously, especially having regard to the difficulty of access to many parts of the area and the impossibility of securing a deputy or of obtaining assistance in difficult cases or those requiring anaesthetics or operations. Sir Watson Cheyne further asked whether the Local Government Board would reconsider the sanction it had given to the appointment to the new post of a young man of military age, when the work could be and was being done by older men resident in the area and occupied in other civilian medical work. Mr. Hayes Fisher referred Sir Watson Cheyne to the answer given to a similar question put by Colonel Wedgwood. That reply stated that the appointment was made jointly by the Cheadle Guardians and the Cheadle Rural District Council, whose areas coincided, and was approved by the Local Government Board for the period of the war. The arrangement was fully considered, and appeared to be the best practicable in existing circumstances. While Mr. Hayes Fisher did not think there was any ground for apprehending that the health of the district would suffer from the arrangement, he would have further inquiry made into the matter. He now added that the doctor appointed was of military age—38 years—but, being a native of India, was ineligible for a commission in the R.A.M.C. Sir Watson Cheyne then asked whether it was not a fact that the dispute arose owing to the local doctors asking for an increase in salary, and was that not desirable in view of the great increase in the cost of living? Mr. Fisher admitted that was the origin of the dispute, but he understood that the local authorities were willing to grant the increase in some cases but not in others. He had no means of judging as to the merits of that decision.

Army Dental Service.—Taking up a number of questions put by Mr. Pennefather and Mr. Whyte, on June 18th, Mr. Macpherson announced that the number of dental surgeons employed in the Royal Army Medical Corps is about to be largely increased. Mr. Whyte put it that the number at present employed with the British Expeditionary Force in France was less than one-half that employed in a similar capacity in the Canadian Expeditionary Force. On that Mr. Macpherson said that before our soldiers went to the front their dentures were looked at by dentists, but the Canadians were not so examined before they left Canada. Mr. Pennefather said that according to his information the teeth of every Canadian were examined before crossing, and there was a re-examination before the man went to the front. There was a further re-examination every time a man came back wounded.

"Manipulative Surgery."—It is announced that an Army Council Instruction has been issued to all commands in the United Kingdom directing that "no obstacle will be placed in the way of an officer or soldier who desires to avail himself of the services of a practitioner in manipulative surgery who is not a qualified practitioner." This follows on a statement by Mr. Macpherson last August that he saw no objection to a soldier going for treatment to an unqualified man, but that if he did he went on his own responsibility.

NOTES ON THE PRESERVATION OF FRUIT.

BY

HERBERT E. DURHAM, Sc.D., ETC.,

PRESIDENT, DEREKENDSHIRE ASSOCIATION OF FRUIT GROWERS
AND HORTICULTURISTS.

THE methods by which fruit may be preserved for a more or less indefinite period are as jam, by bottling or canning, by making into a paste or "massa," and by simple drying. Certain fruits, such as apples and pears of suitable kinds, will keep for many months if properly stored. There are many extremely good sorts of apples which will keep till April, May, and even June. Unfortunately this year the crop of fruits of all kinds in most parts of the country will be poor, and possibly the amount of sugar allowed to the private owner for jam making may be sufficient for his fruit.

As the making of jam in factories is now largely under Government control, it seems not unreasonable to suggest incidentally that the manufacturers should be required to make a declaration as to the substances other than the named fruit used in making the jam. If the basis of a jam is pulp made from apples, plums, or vegetable marrow, the named fruit being practically used only as a flavouring agent, the fact should be declared. One of the merits of jam is that it affords a mode of obtaining in the diet necessary labile substances, vitamins or what-not, when fresh fruit is not available. In a jam factory the fruit, such as currants, is usually "pulped," and kept; it is recooked when the apples are ready, and in this way the vitamins may be lost. The label, "Currant jam: made solely from sound fruit and sugar," may prove misleading to the purchaser, who is apt to assume that the fruit referred to on the label is currant and not largely diluted with apple or vegetable marrow.

Much can be done without sugar at the time of preservation, and the following notes may be of use:

Bottling.—When water without sugar is used in bottling a diffusion of the sugar and other substances in the fruit takes place from within it into the water, until an equilibrium is established. The individual fruits then become little more than tasteless bags, which can only be satisfactorily served at table when mashed into a *purée* or "fool." This may be obviated and a permanent equilibrium established by making juice from some of the fruit and using it to fill up the bottles. The juice may be made either by cooking some of the fruit in a small amount of water and then straining off the juice and squeezing the residue well in a cloth; or by the use of a fruit press—the Enterprise or some similar pattern—which is far more economical and saves time, for leaves and stalks need not be separated from the fruit, the juice thus obtained should be heated before it is put into the bottles. The fruit, of course, may be pulped or the juice only bottled, and then it is perhaps a good plan to use small bottles, so that a whole bottle is soon consumed. The same sort of juice need not be used; for instance, raspberry or red currant juice may be used the one for the other. Plum or apple decocted to a moderately thick syrup might be used, judging from the very fair blackberry jam that can be made by the addition of apple juice from the cider press concentrated to a syrup.

Paste or Massa.—This is a valuable mode of conserving various fruits. It can be utilized in several ways, as by making sauces to eat with puddings, to work up into jam, or, in the case of quince and medlar, to add to apples. Whilst it is more ideal to use sugar in some cases (for example, apple) in the preparation, a product of perfect keeping quality can be made without it. Taking apple and tomato as two types, the treatment is as follows:

Apples are cut up, or waste cores and skins only may be used; they are cooked with the smallest quantity of water possible; then, cooked soft, they are allowed to cool and passed through a fine cloth gauze or sieve to separate pips, etc. The pulp is then slowly reduced with stirring to prevent burning, which may also be partly fended off by wire gauze or a sheet of iron interposed between the direct flame and the saucepan; the reduction is completed when the wooden spoon stands stiffly alone in the pulp (when sugar is available one-tenth to one-fifth the weight of the pulp may be added). The pulp is then poured into well-greased baking trays, or greased paper may be used to line them or plain paper, but in this case it will have to be moistened when ultimately removed. The layer of pulp should be a quarter to half an inch thick. The trays are then placed to dry, either in the rack over the range, in a slow oven, in the linen cupboard, or in bright sunlight, and dried until the residue is fairly hard but still plastic; it is then rolled up (after removal of the paper, if that has been used) or cut up into squares or lozenges, and stored in paper bags or cardboard boxes in a dry, warmish place, when there is no fear of mouldiness ensuing.

Tomatoes are carefully boiled in water without breaking the skins, the water drained away as completely as possible and the pips and skins strained off (or they may be put direct

through an "Enterprise" press), a little salt and, if desired, cayenne and allspice may be added. The *purée* is then slowly reduced to a fairly thick jam, poured into trays, dried and rolled up. Small pieces stirred up with water may be used to flavour soups, stewed haricots or spaghetti, etc. The "massa" keeps perfectly. Should fruit be available, we propose to store black currants, raspberries, etc., by this plan, using, however, the press; as then by two or three passages there is practically no loss of the juice.

The advantage of the paste or massa is that it needs no bottles or jars for its preservation; sugar, where needed, may be added at the time of consumption or final preparation. Apple or quince paste may be made into a jam or *purée* by adding about five times its weight of water, warming slowly for twenty minutes, then just raising to the boil for a short stir.

Simple Drying.—For the simple drying of fruit none of the special outfits advertised is necessary. On a small scale a fair amount can be done with the ordinary baking oven. In a house which possesses a linen or airing cupboard containing a hot-water cylinder, fruit can be dried on a larger scale. Using mainly this method we did last year twenty pounds of dried plums, representing six or seven times their weight in the fresh state. When dried hard they keep perfectly in paper bags. Preliminary treatment in a caustic soda bath or by sulphuring is not necessary, and neither method is likely to add to the dietetic value of the fruit.

Only fruit which is of good size, perfect, and at least nearly ripe, should be used. Fruit which is not perfectly ripe may be spread out on trays made of gauze, wicker, or slats of wood, and kept on the rack over the range for a few days to complete ripening; this is in any case a good plan, as it tends to procure a full flavour. Three or four heatings in a cool oven will be needed. It is important that for the earlier heating the temperature should not be above 115° to 120° F. For the second or third not above 150° F., and for the final not above 160° F. Too high a temperature leads to rupture of the skin, escape of syrupy juice, and a general mess. In practice the oven may be allowed to cool off a little at the end of the day, and the trays left in overnight. Next morning they should be taken out and allowed to cool. During this it is well to turn the fruit; in the evening it should be put into the oven for another night. It is safer to leave the oven door ajar, and this should certainly be done during the daytime when the fire is on. To ascertain the temperature a pan of water may be put into the oven and if the hand cannot be held in it for a full minute the temperature will be 140° F. or more. It is inadvisable to put in fresh fruit with partly dried fruit. Too high a temperature leads to agglutination of the contents of the fruit through destruction of pectins, if not to rupture through swelling.

With the hot cupboard of a hot-water service there is little or no risk of overheating; treatment for a week every day or every few days, with daily withdrawal to cool, is needed to get the complete desiccation I prefer. If the operator stops when the dryness of the ordinary prune has been attained, he must remember that there will be liability to mouldiness if the prunes are stored while still moist in jars or bottles without resort to a final high temperature. With complete desiccation, followed by storage in a dry place, perfect conservation is obtained. If hot sun is available the trays may advantageously be put out; moulds will not grow at body temperature.

As to vegetables, potatoes dry very rapidly in slices, about a quarter of an inch thick; young broad beans and green beans also dry readily, and give a good product; we did not find that preliminary scalding in boiling water for five seconds, as recommended, is an advantage.

THE WAR.

CASUALTIES IN THE MEDICAL SERVICES.

ROYAL NAVY.

Wounded.

Surgeon Probationer H. G. FitzMaurice, R.N.V.R.

ARMY.

Died of Wounds.

LIEUT.-COLONEL H. MOORE, R.A.M.C.

Lieut.-Colonel Henry Moore, R.A.M.C., who was returned on June 5th as wounded, was reported to have died of wounds, in the casualty list published on June 14th. He was educated in the medical school of the Royal College of Surgeons in Ireland, and took the diplomas of L.R.C.P. and S.Irel. in 1892. After serving as medical officer in Basutoland, and as a civil surgeon in the South African Field Force in 1900-1902, he went into practice in Dublin, where he was demonstrator of anatomy to the Royal College of Surgeons in Ireland, surgeon to the Royal City of Dublin Hospital, and surgeon to the Westmorland Lock Hospital. He had also been surgeon to Mercer's Hospital, Dublin. He took a temporary commission as

* In the Lot, the centre of the French dried fruit industry, fruit is dried on wicker hurdles in the sun. The "Imperial" plums in glass jars are finally put through an autoclave.

lieutenant in the R.A.M.C. on August 11th, 1914, was promoted to captain on completion of a year's service, and recently to temporary lieutenant-colonel. He received the Military Cross on June 3rd, 1917.

CAPTAIN K. ATKIN, R.A.M.C.

Captain Keyser Atkin, R.A.M.C., died of wounds at a dressing station on June 6th, aged 25. He was the only son of Mr. P. W. Atkin, stipendiary magistrate of Salford, and was educated at Cambridge, where he gained his rowing blue in 1913 and graduated B.A., and at Manchester University. He took the diplomas of M.R.C.S. and L.R.C.P.Lond. in 1916, and after acting as house-surgeon at the Manchester Royal Infirmary, and as house-physician at St. Mary's Hospital for Women and Children, Manchester, took a temporary commission as lieutenant in the R.A.M.C. He was promoted to captain after a year's service, and was taken prisoner last year, but exchanged a few months ago.

CAPTAIN W. F. McISAAC, C.A.M.C.

Captain W. F. McIsaac, Canadian Army Medical Corps, was reported as having died of wounds, in the casualty list published on June 13th. He was previously returned on June 3rd as wounded in the attack on the Canadian hospitals at Etaples towards the end of May.

LIEUTENANT J. W. SENTER, R.A.M.C.

Lieutenant John Watt Senter, R.A.M.C., died of wounds on June 9th. He first qualified as a chemist, and while carrying on that business went through the medical course at Edinburgh University, where he graduated M.B. and Ch.B. in 1910, and B.Sc. in Public Health in 1912. After acting as house-surgeon in the eye department, and in the ear, nose, and throat department, at Edinburgh Royal Infirmary, he went into practice in Mayfield Road, Edinburgh. He took a temporary commission in the R.A.M.C. in June, 1917. He had previously served in the South African war.

Wounded.

Lieut.-Colonel G. J. Ormsby, D.S.O., R.A.M.C.
Major F. L. Bignell, Australian A.M.C.
Major G. S. Mothersill, D.S.O., Canadian A.M.C.
Captain J. N. L. Blamey, R.A.M.C. (temporary).
Captain D. A. Davis, Australian A.M.C.
Captain W. B. Gordon, R.A.M.C. (temporary).
Captain F. Hall, R.A.M.C. (temporary).
Captain S. A. Henry, R.A.M.C. (temporary).
Captain T. H. Houston, R.A.M.C. (temporary).
Captain A. H. Huycke, R.A.M.C. (temporary).
Captain J. E. W. Macfall, R.A.M.C. (T.F.).
Captain L. L. Sawow, M.C., R.A.M.C. (temporary).
Captain W. N. Soden, M.C., R.A.M.C. (temporary).
Captain H. M. Stephenson, M.C., R.A.M.C. (temporary).
Captain H. P. Thompson, R.A.M.C. (temporary).
Captain T. R. Trounce, R.A.M.C. (temporary).
Captain W. Wilson, R.A.M.C.
Lieutenant F. Coates, R.A.M.C. (temporary).
Lieutenant and Quartermaster L. E. Hine, R.A.M.C.

Missing.

Lieut.-Colonel W. B. Kelly, D.S.O., R.A.M.C.
Major F. G. Lescher, M.C., R.A.M.C. (S.R.).
Captain T. Blackwood, R.A.M.C. (temporary).
Captain R. M. Coalbank, R.A.M.C. (temporary).
Captain C. R. Crowther, R.A.M.C. (T.F.).
Captain W. F. Dunlop, R.A.M.C. (temporary).
Captain M. S. Esler, R.A.M.C. (temporary).
Captain D. Gillespie, R.A.M.C. (temporary).
Captain W. G. Harnett, R.A.M.C. (temporary).
Captain G. F. F. Heathcote, M.C., R.A.M.C. (temporary).
Captain N. A. A. Hughes, R.A.M.C. (temporary).
Captain C. C. Jones, R.A.M.C.
Captain H. F. McCoughy, R.A.M.C. (temporary).
Captain W. T. P. Meade-King, R.A.M.C. (T.F.).
Captain H. S. Moore, R.A.M.C. (temporary).
Captain R. W. Pearson, M.C., R.A.M.C. (temporary).
Captain A. B. Simpson, R.A.M.C. (temporary).
Captain D. M. Smith, R.A.M.C. (temporary).
Captain C. Wits, R.A.M.C. (temporary).
Lieutenant A. Boyle, R.A.M.C. (temporary).
Lieutenant A. S. Findlay, R.A.M.C. (temporary).
Lieutenant J. Findlay, R.A.M.C. (temporary).
Lieutenant J. W. Jones, R.A.M.C. (temporary).
Lieutenant F. W. M. Lamb, R.A.M.C. (temporary).

Lieutenant A. M. McCormick, R.A.M.C. (temporary).
Lieutenant F. B. O'Dowd, R.A.M.C. (temporary).

Prisoners of War.

Major J. S. McConnachie, R.A.M.C. (T.F.).
Captain M. T. Ascough, R.A.M.C. (T.F.).
Captain W. M. Christie, R.A.M.C. (temporary).
Captain S. S. Meighan, R.A.M.C. (T.F.).

DEATHS OF SONS OF MEDICAL MEN.

Beresford, Spencer Charles, Second Lieutenant 1st Royal Berkshire Regiment, eldest son of Dr. C. W. Beresford of Markyate House, Narborough, near Leicester, killed in action in France, June 5th, 1918.

Thomas, Francis Gerald, Captain in the merchant service, fifth son of William Thomas, M.B.Lond., F.R.C.S., of Birmingham, torpedoed at sea, June 8th, 1918.

Thomas, Geoffrey Lynn, M.C., Captain R.F.A., elder son of Dr. Iwan Thomas of Maesffrw, Hirwain, killed recently, aged 24. He got his first commission on November 16th, 1914.

Thorne, T. Bezley Houghton, Lieut.-Colonel North Staffordshire Regiment, son of the late Dr. Bezley Thorne, killed March 21st. He served through the South African war, was mentioned in dispatches, and received both King's and Queen's medals, with five clasps. He became lieutenant in the Reserve of Officers on March 29th, 1901. On October 14th, 1914, he was appointed major in a service battalion of the Duke of Cambridge's Own Middlesex Regiment, and went to France in that capacity early in 1915, and in 1916 was appointed to command a battalion of the North Staffords.

[We shall be indebted to relatives of those who are killed in action or die in the war for information which will enable us to make these notes as complete and accurate as possible.]

MENTIONED IN DISPATCHES.

The following are among the names mentioned by General Sir E. H. H. Allenby, Commander-in-Chief, Egyptian Expeditionary Force, in a dispatch dated April 3rd, as deserving of special mention for distinguished and gallant services and devotion to duty:

Royal Navy.

Temporary Surgeon A. H. Richardson.

Staff.

Colonel G. T. K. Maurice, C.M.G., A.M.S.
Brevet Colonel W. W. White, I.M.S.
Lieut.-Colonel (temporary Colonel) E. P. Sewell, D.S.O., R.A.M.O.
Lieut.-Colonel A. L. Dawson, A.A.M.C.
Major C. E. Hercus, N.Z.M.C.
Captain F. W. C. Brown, R.A.M.C.

Army Medical Service and Royal Army Medical Corps.

Colonel D. O'Sullivan.
Lieut.-Colonel W. P. Gwynn.
Temporary Lieut.-Colonel J. W. Barrett, C.B., C.M.G.
Major (acting Lieut.-Colonel) W. F. Ellis.
Captains (acting Lieut.-Colonels): H. W. Carson, G. F. Rudkio, D.S.O.
Captain (acting Major) W. W. Treves.
Captain W. H. Sheffield.
Temporary Captain (acting Lieut.-Colonel) A. T. Mulhall.
Temporary Captains: L. Leslie, the Hon. L. H. Liodley, T. F. Lumb, P. W. Moore, E. B. Smith, J. G. Willmore.
Lieutenant (temporary Captain) E. Catford.
Temporary Lieutenant H. G. Sparrow.
Quartermaster and honorary Captain T. E. Coggon.

Indian Medical Service.

Lieut.-Colonel R. W. Knox, D.S.O.
Majors S. W. Jones, M. F. White.

Royal Army Medical Corps (T.F.).

Lieut.-Colonels: T. H. Forrest, D.S.O., A. G. Hamilton, H. W. Thomson.
Major (acting Lieut.-Colonel) J. W. Leitch.
Captain (temporary Lieut.-Colonel) J. Young.
Captains (temporary Majors): T. G. Buchanan, H. J. Dunbar.
Captain (acting Lieut.-Colonel) T. B. Layton.
Captains: C. H. Allen, C. S. P. Black, M.C., C. H. Budd, M.C., W. K. Churchouse, H. N. McCoombs, M.C., W. F. Corfield, A. D. Downes, W. T. Henderson, E. A. Mackenzie, G. R. Rickett, A. B. P. Smith, J. B. Stanley, O. Teichmann, M.C., F. Ward, G. H. H. Waylen, G. A. Williamson, K. B. Williamson.
Temporary Captain C. W. Jenner.

Australian Army Medical Corps.

Lieut.-Colonel R. Fowler.
Major (temporary Lieut.-Colonel) G. E. M. Stuart.
Major C. V. Single.
Captain E. T. Pascoe.
Honorary Lieutenant G. G. Grant.

Italian Medical Corps.

Capitano V. Bianchi.

The list also contains a number of names of warrant officers, N.C.O.'s, and privates of the R.A.M.C., R.A.M.C. (T.F.), A.A.M.C., N.Z.M.C., and of the I.S.M.D., as well as some members of the British Red Cross and Voluntary Aid Detachment.

ORDER OF THE BRITISH EMPIRE.

The names of Colonel Francis John Walker, V.D., County Director, Auxiliary Hospitals and V.A.D.'s, North Lincolnshire, and Major Robert Henry Hogg, officer in charge of New Zealand Officers' Hospital, Brockenhurst, should have been included in the list of those appointed as Officers of the Order of the British Empire published last week, p. 680.

Correspondence.

AGGLUTINATION IN THE DIAGNOSIS OF DYSENTERY.

SIR,—In the interesting and important article which appeared under the above title in your number of June 8th Lieut.-Colonel C. J. Martin and his fellow-workers make the following reference to Dreyer's system of standardization of agglutinable cultures:

The results are expressed in terms of Dreyer's standard agglutinin units by taking into account the factor on the bottle representing the relative agglutinability of the particular sample according to its behaviour with some arbitrarily selected serum. (My italics.)

It is to be feared that this statement will give the reader an erroneous idea of Professor Dreyer's system, for it is not the behaviour of the culture with any sample of serum that determines its numerical factor of agglutinability, but its behaviour (using any serum) as compared with an arbitrarily selected formalized broth culture, which is taken as a standard, or with another culture that has been standardized against the original one. This fact is of prime importance because formalized cultures possess a very much higher degree of stability than any serum, and it is just this that makes it possible to use them as standards.

To quote the "Directions for the Preparation and Standardization of Agglutinable Cultures," issued to all who use these materials:

The process of standardization (of a culture) consists . . . in measuring its agglutinability as compared with the standard agglutinable culture by the use of the standard serum. (My italics.)

I have thought it all the more necessary to draw attention to this misunderstanding because of the large audience which Colonel Martin's article is sure to have and because of the authoritative value attached to any statement made under his name.—I am, etc.,

A. D. GARDNER, M.D., F.R.C.S.,
Bacteriologist in Charge of the Standards
Laboratory.

University of Oxford,
June 18th.

THE NERVOUS TEMPERAMENT IN WAR.

SIR,—Your editorial under the above heading on June 8th (p. 649) is at the present time of great practical interest.

It would appear that Professor Dupré claims to describe a definite clinical entity under the term "*constitution emotive*," and that I do not dispute, but I fail to see that he describes any new condition not already familiar to some of us long before the war, and so thoroughly described by several British writers under the names "*neurasthenia minor*," "*neurasthenoid*," "*pre-neurasthenic*," etc. Personally, I think that the term "*congenital neurasthenia*" is preferable, because of the strong hereditary element in the production of this lifelong condition, which is allied to true neurasthenia and into which it may easily develop, by any strong emotional shock, or after the age of about 40, when the fading activities of the kidneys, etc., leads to auto-intoxications.

Although, as pointed out, an exaggerated response to stimuli is normal in infancy and perhaps childhood, yet in the neurasthenoid child or congenital neurasthenic the sensitiveness is still further exaggerated.

The signs and symptoms whereby Dupré characterizes his "*constitution emotive*" are largely covered by those of neurasthenia minor, the manifestations of which, both on the physical and mental side, are too numerous to refer to here, but are so admirably described by such writers as Clive Riviere and Campbell Smith, etc.

The point of practical interest at the present day about the congenital neurasthenic is that his or her outlook on life is markedly different from that of normal sane people. Just as there is a lack of inhibition on the physical side, so there is on the mental side, as exhibited by impulsiveness, low psychopathic point, exaggerated ideas, and a host of other psychasthenic conditions. Their phobias, which take many different forms, may make life a terror for them.

The war no doubt has brought these individuals into prominence, but, like the poor, they are always with us, though somewhat sparsely scattered. During a period of

examining recruits at the early part of the war I came across a few of these cases, one of whom I specially remember nearly collapsed from fright; he had been made to offer to enrol by his employer. If one judges recruits simply by their physical make-up these cases may easily be overlooked, and that would be a gross blunder, as this condition quite unfits them for soldiers. The tell-tale rapid heart should, however, always put us on the *qui vive* for other symptoms which point more conclusively to this condition of congenital neurasthenia. Mentally, morally, and physically, these cases do not make good soldiers, and instead of being subsequently discharged after costing the nation say £100, they should be rejected at the beginning. They are, I suspect, the material out of which are made some, if not most, of our conscientious objectors, to say nothing of certain anticonscriptionists and bomb dodgers, so that their loss to the army would be practically nil.—I am, etc.,

June 10th.

LATE CIVIL SURGEON.

A COMMON RESPIRATORY DISABILITY.

SIR,—What is to be done to lessen the future incidence of the very common sufferer from the effects of nasal obstruction?

During these very trying times there are referred to the tuberculosis officer large numbers of men called up for military service or discharged, who, while able to do hard work, are quite unfit for training. Retraction and emphysema, with resulting enlarged right heart, do not prevent such a man working as a blacksmith or even as a coal-miner, but a short spell of service makes them problems for the Local Pensions Committee.

The patient usually says that asthma is in the family, and it is certain that heredity is the chief factor in producing the disability.—I am, etc.,

Newport (Mon) June 2nd.

J. LEWIS THOMAS.

PAY OF TERRITORIAL OFFICERS.

SIR,—Notice that, in answer to Commander Bellairs, Mr. Forster stated in the House of Commons that Territorial officers of the R.A.M.C. got the same emoluments as regular officers. This is incorrect. A regular captain R.A.M.C. receives 15s. 6d. a day on promotion, after seven years' service 17s., and after ten years 21s. A Territorial officer of the same service still receives the minimum rate of 15s. 6d. This, of course, is due to the refusal of the War Office to recognize pre-war service as qualifying for the extra pay. As is well known, scores of Territorial medical officers had on mobilization to relinquish good practices and comfortable incomes, and who at the present time are, after several years of pre-war service, receiving the minimum pay of a captain R.A.M.C.—I am, etc.,

June 11th.

MAJOR R.A.M.C.(T.F.).

Obituary.

LOUIS ALBERT DUNN, M.S.LOND., F.R.C.S.,
Senior Surgeon to Guy's Hospital.

MR. L. A. DUNN died in the private ward of Guy's Hospital in the early morning of June 8th, after a long and trying illness. He was the youngest son of the late J. Roberts Dunn, J.P., D.L., of Stone House, Warbleton, Sussex, and was born in 1858. At Guy's Hospital he gained the Ormerod Scholarship, and obtained the diplomas M.R.C.S. and L.S.A. in 1882. In the following year he graduated M.B. and B.S.Lond. with honours; in 1884 he became F.R.C.S., and in 1888 took the M.S. degree, winning the gold medal. Mr. Dunn's whole career was bound up with Guy's Hospital and its medical school, in which he held successively the posts of demonstrator of anatomy, surgical registrar, warden of the College, assistant surgeon, joint lecturer on surgery, and surgeon. He was also consulting surgeon to the East London Hospital for Children, and to St. Mary's Children's Hospital, Plaistow. He served for ten years as a member of the Court of Examiners of the Royal College of Surgeons, and was elected to the Council in 1913.

We are indebted to Mr. F. J. STEWARD for the following appreciation:

The news of the death of L. A. Dunn will bring a sense of real personal loss to a very large number of Guy's men.

For "John" Dunn, as he was always called at Guy's, was, from the day he became demonstrator of anatomy until his last illness, above all the students' friend, and many are those who realize that but for his kindly and persevering teaching they would in all probability never have qualified. After a brilliant student career John Dunn became demonstrator of anatomy in 1885, and held this post until he was appointed assistant surgeon in 1894. In the dissecting room he acquired a quite extraordinary influence over the boys, as he called them, for, besides being an unusually clear and helpful teacher, he had a great charm of manner, and took a real personal interest in each of his pupils, thus gaining the friendship and getting the best out of each one. At the same time he was a strict disciplinarian, for, kindly and familiar as he was, he had complete control, and never permitted laziness or slackness in attendance. And so again in the wards and out-patient department his clear, patient, and helpful clinical teaching was an immense boon to generations of students, each of whom he knew and understood and remembered in a quite remarkable degree. In fact, it seemed to those who knew him best that his greatest interest in life was his teaching and his personal relationship with the students. That all he did for them was properly appreciated by the men is not in doubt, for it would be hard to imagine a teacher more popular and universally more loved and esteemed. He was a very accurate clinical observer and was also possessed of a great clinical memory; often has he thrown some fresh light on a difficult case seen with the writer or others of his colleagues. As an operator, whilst he would not be described as either brilliant or showy, his work was always neat, decided, and accurate. Charming and friendly to all with whom he came in contact, he was also retiring and self-contained almost to exasperation, so that even his oldest and best friends saw really but little of him.

SAMUEL POZZI,

Professor of Clinical Gynaecology, Paris.

PROFESSOR POZZI, whose name is well known wherever surgery is practised, was murdered in his consulting room on June 13th. His murderer, who immediately afterwards committed suicide, was a man upon whom Professor Pozzi had operated about two years ago, and his grievance was that his surgeon would not operate upon him again. Professor Pozzi was wounded in the abdomen by four revolver shots. On his own instructions he was removed to the Astoria Hospital, where laparotomy was performed, twelve perforations of the intestine and a wound in the kidney being found. He survived only a few hours.

Samuel Pozzi was born at Bergerac (Dordogne) on October 3rd, 1846. He had a brilliant career as a student, becoming interne of the Paris hospitals in 1868 and winning the gold medal of the faculty in 1872. In 1873 he graduated with a thesis on fistulae of the upper pelvic space, for which he was awarded a bronze medal, and in 1875 he became *agrégé* with a thesis on the value of hysterotomy in the treatment of uterine fibroma. He was already well known by his work in comparative anatomy when he was elected surgeon to the hospitals in 1877. In 1878 he was appointed surgeon to the public lunatic asylums of the Seine Department, and in 1885 he was attached to the Lourcine hospital. From that time he gave his attention mainly to diseases of women, and was one of the pioneers of operative gynaecology in France. He was the author of a treatise on clinical and operative gynaecology which has gone through several editions. For this work, which has been translated into English, German, Italian, and Spanish, he was awarded a prize by the Institute of France. Among his many contributions to medical literature are an important article in the *Dictionnaire Encyclopédique des sciences médicales* and a translation, made in conjunction with Dr. Benoit, of Charles Darwin's book on the expression of emotions in men and animals. Pozzi was one of the founders of the French Congress of Surgery, of which he was general secretary till 1885. He was brilliant as a teacher not only in gynaecology but in anatomy and operative surgery. He was a favourite pupil of Broca, and in 1888 held the office of president of the Society of Anthropology. At the time of his death Professor Pozzi was professor of clinical gynaecology and surgeon to the

Broca Hospital, and director of the surgical division of the military hospital at the Panthéon. He was a member of the Académie de Médecine, was elected vice-president this year, and would have been president next year. He was senator for his native department for nine years.

Universities and Colleges.

UNIVERSITY OF CAMBRIDGE.

C. R. A. THACKER, M.B., B.C., has been elected to a Fellowship at Sidney Sussex College. The following medical degrees have been conferred:

M.D.: W. A. Stokes, W. J. Fison. M.O.: H. J. Gauvain. M.B.: K. B. Alkman.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.

AN ordinary Council was held on June 13th, when Sir George Makins, G.C.M.G., President, was in the chair.

The late Mr. L. A. Dunn.—A vote of condolence was passed on the recent death of Mr. Dunn, a member of the Council and past member of the Court of Examiners. The vacancy in the Council occasioned by the death of Mr. Dunn will be filled up at the annual meeting of Fellows in July, 1919.

Grant of Diplomas.—Diplomas of Fellowship were issued to two candidates (Messrs. Ernest F. Murray and David P. D. Wilkie) found qualified at the recent examination. A third candidate (Mr. Arthur Morford) was found qualified, but being under the age of 25, the grant of the diploma was deferred. The Licence in Dental Surgery was granted to eleven candidates found qualified at the recent examination.

Donations.—The thanks of the Council were given to Mr. I. Foster Palmer, M.R.C.S., for a donation of books and engravings.

The Primary Examination for the Fellowship.—A Committee was appointed to consider the desirability of altering or amending the subjects and character of the primary examination for the Fellowship.

Military Orthopaedics.—A letter was read from a provincial hospital calling attention to the manner in which the hospitals and medical schools are being affected by the steps taken by the Ministry of Pensions, in conjunction with the War Office, to eliminate cases of military injuries on a very wide definition of "orthopaedics" from treatment in certain civil hospitals. The matter was referred to a committee.

Proposed Formation of a Ministry of Health.—A committee was appointed to consider the steps which are being taken to form a Ministry of Health, the committee to co-operate with a similar committee appointed by the Royal College of Physicians.

Medical News.

IT is announced from Amsterdam (June 16th) that an epidemic presenting symptoms similar to that which prevailed recently in Spain, and believed to be influenza, has broken out in Berlin.

PROFESSOR DENTI of Milan has taken the initiative in collecting funds for the establishment of a workshop for men blinded in the war. The subscriptions already amount to £14,360.

WE are informed that the Scottish Women's Hospital evacuated, as mentioned last week, was the advanced hospital at Villers Cotterets. The work of the main hospital at Royanmont, near Chantilly, described by Miss Ivens in our columns on August 18th, 1917, has not been interrupted.

DR. VERNON DAVIES, M.B.E., has been appointed a Knight of Grace of the Order of St. John of Jerusalem in England.

ON the occasion of the twenty-first anniversary of St. Paul's Hospital for Skin and Genito-Urinary Diseases, Dr. Felix Vinrace and Dr. Alfred Allport were entertained to dinner at the Holborn Restaurant on June 14th.

THE proceedings of the Conference on the administration of the Mental Deficiency Act, held in London last February, have been printed in a pamphlet, copies of which can be obtained from the honorary secretary of the Central Association for the Care of the Mentally Defective, Queen Anne's Chambers, Tothill Street, Westminster, S.W.1.

CIVILIAN practitioners desiring to attend the course of instruction on war neuroses and shell shock at the Maudsley Neurological Clearing Hospital (Denmark Hill, S.E.5), for which no fees are charged, are, by desire of the Director-General, A.M.S., requested to bring a letter of introduction from a hospital physician or surgeon. The course begins on Tuesday next at 3 p.m., and will be continued on Tuesdays and Fridays for six weeks.

JUST as the Director-General of the British Army Medical Service has no seat on the Army Council, so the Surgeon-General of the United States Army is not a member of the American General Staff. We learn from the *Journal of the American Medical Association* that a bill has recently been introduced into the House of Representatives proposing that hereafter the Surgeon-General shall be a member of the General Staff Corps.

THE British Thomson-Houston Co., Ltd. (77, Upper Thames Street, London, E.C.4) has completed a scheme for repairing Coolidge x-ray tubes which have been damaged or broken.

THE Swiney prize, founded to encourage work on jurisprudence, by Dr. Swiney, who died in 1844, is awarded alternately by the Royal Society of Arts and the Royal College of Physicians for medical and for general jurisprudence. On the last occasion (1914) the prize, which consists of a cup value £100 and money to the same amount, was given for a work on general jurisprudence. The next award, which will be made in January, 1919, will be for a work on medical jurisprudence.

THE annual general meeting of the Asylum Workers' Association, founded in 1895 to promote the betterment of the condition of all classes of persons engaged in the care of those afflicted in mind, was held at the Mansion House, under the presidency of the Lord Mayor, on May 29th. The adoption of the report, which showed an increase of membership and of funds during 1917, was moved by Sir John Jardine, Bt., M.P., President of the Association, who referred to the desirability of further legislation to secure for asylum workers the full benefits which the Asylums Officers' Superannuation Act, obtained by the efforts of the association in 1909, in part conceded to them. The Dean of Windsor, who seconded, laid stress on the need of ample recreation for those engaged in nursing the sick, whether in body or mind, in order to maintain the freshness of spirit so essential in their dealings with patients. Dr. Mercier drew from his reminiscences, some of which were of a very piquant character, to emphasize the call on the long suffering, good nature, self-sacrifice, and devotion to duty of those engaged in nursing mad folk, and to show how much they merited the sympathy of the community at large, especially at this time, when war exigencies had depleted the personnel of asylums. It was, he said, much to the credit of these workers that in a period of such stress the Board of Control had been able to report an unprecedentedly low number of suicides occurring amongst asylum patients. Amongst other speakers were Sir Frederick Needham, Sir George H. Savage, Lieut.-Colonel D. Thomson, Captain Kirkland Whittaker, R.A.M.C., and Major the Rev. S. Lipson, S.C.F.

others. Reference should be made to Nettleship's paper (*Trans. Ophthalmological Society, U.K.*, vol. xxvii, p. 269), wherein will be found the pedigree of a French family affected with hereditary night blindness in which the defect is known to have occurred in ten generations living through a period of three hundred years; also reference may be made to Nettleship's Bowman Lecture (in the same *Transactions*, vol. xxix, pp. cii and ciii), in which will be found reference to cases of hereditary retinitis pigmentosa and lamellar cataract.

LETTERS, NOTES, ETC.

WAS DR. FARQUHARSON ENTITLED TO THE EAGLE'S FEATHER?

DR. CLIPPINGDALE (London, W.) writes: Many Scottish readers of the *BRITISH MEDICAL JOURNAL* will remember that the head of the clan Farquharson is entitled to wear upon his bonnet an eagle's feather. The Farquharsons of Finzean, of which Dr. Robert Farquharson was the head, contested the chieftainship of the clan with the Farquharsons of Invercauld, of which Mr. James Ross Farquharson is the head. Both septes are descended from Mor Farquharson, bearer of the royal standard at the battle of Pinkie in 1547, and both bear the Scottish standard as part of their armorial ensigns. The Farquharsons of Invercauld are, or were, descended from an elder son of Mor Farquharson, the Farquharsons of Finzean from a younger son. In 1806, however, the Farquharsons of Invercauld came to an end by the death of James Farquharson, who left no son, but a daughter who married Captain James Ross, R.N., who assumed the name and arms of Farquharson. It is to be presumed that the chieftainship of this ancient clan fell upon the late Dr. Farquharson, and with it whatever glory attached to the wearing of the eagle's feather. Those who had the pleasure of attending the ball given in Mareschal College during the meeting of the Association in 1914, will remember the striking impression created by the late Dr. Farquharson, who came with kilt, dirk, sporran, and all the other accoutrements of a Highland chief.

TUBERCULIN TREATMENT OF PULMONARY TUBERCULOSIS.

DR. MARJORIE HARCOURT (London) writes: For many years, in Australia and America, I used the "tuberculinum purum" of Russian manufacture with all the success from its use that I could have desired. The cases were chiefly of the afebrile type, and in the early stages of the disease those of the febrile type being less amenable to this form of treatment. In every case, without exception, the old method of forced feeding was also adopted, together with any general systemic treatment which was indicated. The tuberculin was used in graduated doses, very slowly increased week by week, and occasionally a week or more was allowed to elapse after the next injection was due. In no case was a patient allowed out of bed for the first twenty-four hours after every injection, often for forty-eight hours or more—until, indeed, there was not any indication of the slightest rise in temperature, and twenty-four hours thereafter. This treatment did not hinder the patients taking graduated exercises as soon as they were out of bed each week, such exercises consisting chiefly in gardening, wood-chopping, house repairing, etc.—anything suitable in individual cases which was also useful. Some of my poorer patients were treated along these lines in their own homes, they or their relations reporting once or twice a week after the first day after injection every week, with such happy results that I can ask for nothing better than to have as many tuberculous cases as I can manage myself personally. No disease has been so amenable to treatment in my hands as pulmonary tuberculosis in the manner I evolved for myself from the teachings of Sir Robert Philip of Edinburgh, whose pupil I was a dozen years ago.

MEDICAL SICKNESS AND ACCIDENT SOCIETY.

AN OLD MEMBER writes: I should like to support the protest of "Dissatisfied" as to the sudden stoppage of the bonus to those going out of benefit. Old members like myself have for years put up with the loss of the quinquennial bonus, looking for the proffered bonus at the end of our time. We feel we are hardly treated by this sudden change from what we were led to expect. I agree with the proposal that a special meeting should be held.

SCALE OF CHARGES FOR ADVERTISEMENTS IN THE BRITISH MEDICAL JOURNAL.

	£	s.	d.
Seven lines and under	0 6 0
Each additional line	0 0 9
Whole single column	4 0 0
Whole page	12 0 0

An average line contains six words.

All remittances by Post Office Orders must be made payable to the British Medical Association at the General Post Office, London. No responsibility will be accepted for any such remittance not so safeguarded.

Advertisements should be delivered, addressed to the Manager, 429, Strand, London, not later than the first post on Wednesday morning preceding publication, and, if not paid for at the time, should be accompanied by a reference.

NOTE.—It is against the rules of the Post Office to receive *poste restante* letters addressed either in initials or numbers.

Letters, Notes, and Answers.

AUTHORS desiring reprints of their articles published in the *BRITISH MEDICAL JOURNAL* are requested to communicate with the Office, 429, Strand, W.C.2, on receipt of proof.

The postal address of the *BRITISH MEDICAL ASSOCIATION* and *BRITISH MEDICAL JOURNAL* is 429, Strand, London, W.C.2. The telegraphic addresses are:

1. EDITOR of the *BRITISH MEDICAL JOURNAL*, *Ailology*, Westrand, London; telephone, 2631, Gerrard.

2. FINANCIAL SECRETARY and BUSINESS MANAGER (Advertisements, etc.), *Articulate*, Westrand, London; telephone, 2630, Gerrard.

3. MEDICAL SECRETARY, *Medisecra*, Westrand, London; telephone, 2634, Gerrard. The address of the Irish Office of the British Medical Association is 16, South Frederick Street, Dublin.

The address of the Central Medical War Committee for England and Wales is 429, Strand, London, W.C.2; that of the Reference Committee of the Royal Colleges in London is the Examination Hall, 8, Queen Square, Bloomsbury, W.C.1; and that of the Scottish Medical Service Emergency Committee is Royal College of Physicians, Edinburgh.

QUERIES AND ANSWERS.

RETINITIS PIGMENTOSA.

ENQUIRER.—The primary cause of retinitis pigmentosa is not known. To judge by the similarity of effects in other conditions it would appear that the primary defect lies in the blood supply to the retina. Experience shows that there is a progressive diminution of the field of vision, and ultimately of the visual acuity, in all these cases; but the rate of progress of the disease varies widely—very many retain good vision until late in life. Two or more cases may occur in the same family, and are frequently associated with other defects of the body, and particularly of hearing, but not all are hereditary or even familial. Cases which may be considered to be of a congenital and developmental type, in which the condition is atypical (in the common absence of observable retinal changes, or of changes of any extent) and remains stationary, have been minutely described and recorded by Nettleship and

GUNSHOT WOUNDS OF THE KNEE-JOINT:

THE CONSERVATIVE OPERATION AT THE CASUALTY CLEARING STATION.

BY

MAJOR RICHARD CHARLES, R.A.M.C.(T.C.).

WHEN Colonel Gray published his first article on the conservative treatment of gunshot wounds of the knee-joint as carried out by him at the base,¹ it was decided to adapt his principles to treatment at the casualty clearing station. It soon became apparent that this procedure was justified, and as time went on and technique improved conservatism became more and more the routine practice. It is now matter for regret that any case requiring operative treatment is ever transferred to the base before operation; results are so much better when operation can be performed within twenty-four hours of the patient being wounded.

It is not proposed to repeat in this article what has already been written on the classification of cases according to the respective indications for amputation, resection of the knee-joint, conservative operation, or expectant treatment, but to confine it to a description of the technique of the conservative operations.

X RAYS.

Operations should never be attempted without the evidence of radiography when this is available. Accurate knowledge of the position of the foreign body and the extent of bone injury is invaluable in determining the procedure to be adopted in any case. The most useful examination is one yielding a stereoscopic radiograph combined with the cutaneous marking of the position and depth of any foreign body present. Such an examination can usually be carried out with the patient in the dorsal decubitus throughout.

OPERATION.

1. Bloodless Field.

Our primary object is the scrupulous excision of infected material from the joint and its surroundings without spreading sepsis in so doing. To obtain this object I consider it absolutely necessary to secure a bloodless field throughout the operation. The first step, therefore, is to apply an Esmarch's bandage from the foot upwards to a point above the knee-joint where the tourniquet is fixed.

2. Sterilization of Skin.

The skin all round the knee is thoroughly washed, shaved, cleansed with spirit, and painted with a solution of picric acid (5 per cent.) in spirit. The wound or wounds must then be gently packed with gauze to prevent leakage of infected fluid on to the skin.

3. Excision of the Track and Wound.

The whole success of the case depends upon attention to every detail which can contribute to the removal of soiled tissue without carrying infection into fresh tissue. In nearly all cases it is possible to remove the entire track of the missile intact down to the joint cavity without permitting the knife or other instrument to touch the track or the infected surface of the wound. Should such an accident occur, the soiled instrument or glove is immediately discarded. As the field of operation is bloodless every cut of the knife can be followed by the eye, and one is not hampered by the presence of artery forceps or swabs, which, moreover, so often contribute to the spreading of infection. The incision employed for excising the wound varies according to the size and position of the wound, and should always be made with a view to extending it so as to give free access to the joint. Having isolated the wound by an elliptical skin incision, the skin surrounding the ellipse is freely undermined all round; its edges are then protected by oiled silk and retracted. In excising the track the deep tissues are not usually removed

to an extent corresponding to the area of the skin incision. The next step, therefore, is to undermine this elliptical area of skin and get close up to the track. So far as the outer portion is concerned the track and wound are now ready for excision, but it is first necessary to carry the incision on one side down through all layers into the joint cavity to permit a view of the deep end of the track. With these landmarks established the tissues enclosing the whole length of the track are excised in one piece. This stage calls for a most patient dissection under severely aseptic conditions, and, being carried out with both ends of the track in view, it entails a minimum loss of valuable fibrous structure.

4. Investigation of Joint.

All used instruments and gloves are exchanged for clean ones. The original opening is then enlarged and the state of the joint investigated. Most of the conditions encountered are dealt with below.

5. Removal of Foreign Body and other Infective Matter.

The missile may be found loose in the joint cavity. In this case it is removed, and, if no injury is present within the joint, the cavity is

thoroughly irrigated, and the joint closed in layers with a view to healing by first intention.

If the missile is found impacted in the bone, and access can be got to it by enlarging the incision, this is done even if it entails division of the tendo patellae. Free access to the joint is essential, and I frequently sever the tendon for this purpose. The site of the foreign body is then isolated from the rest of the joint by gauze wrung out of saline, and the foreign body, together with the portion of bone surrounding it, is cut clean out in one piece. A sharp osteotome and hammer are used for this purpose, and it is important to go deep enough to ensure that no surface of bone is left that has been in contact with the foreign body. The joint is then irrigated and closed.

When the missile is situated on the side opposite to the wound, and if there is no injury to the intervening tissues, the original opening is closed and a fresh incision made directly over the missile.

Injuries to the Bone.—Grooved injuries are always treated as foreign bodies and excised *en masse*. Small comminuted fractures and chipping of the bone are dealt with in the same careful and thorough manner, the fractured surface being chiselled away along with the adherent fragments.

With regard to the excision of bone, as above described, though applicable to the greater part of the joint surface, there are cases in which it is difficult to apply it to the neighbourhood of the mid-line of either bone in the centre of the joint. Severe lesions in this region often penetrate further into the bone than examination reveals or the surgeon can excise, and in these cases one may feel compelled to resect the joint. However, even in such cases, by reflecting the patella and employing Carrel-Dakin treatment from the start, one can often save the joint. When the bone lesion is small and the conditions

FIG. 1.—Specimen of excised wound *en masse*, operation on third day. A, Shrapnel bullet buried in synovial membrane. B, Point at which the ball entered through synovial membrane. C, Capsule. D, Subcutaneous tissue. E, Synovial membrane. F, Skin.

FIG. 2.—Specimen of large foreign body with surrounding bone cut out *en masse* (Case XII). A, Cartilage found lying loose in joint. B, Tip of foreign body. C, External condyle. D, The foreign body in cancellous tissue.

FIG. 3.—Specimen of comminuted patella, with wound and track excised *en masse* (Case IV). A, Lower portion of patella. B, Upper portion of patella. C, Quadriceps tendon. D, Fat and subcutaneous tissue. E, Skin. F, Patella end.

otherwise favourable, the infected area may be everted and the joint closed after thorough irrigation. Another type of wound presenting difficulty and necessitating a departure from the principles above detailed is comminution, or chipping of the head of the tibia on either side, associated with a wound of entrance through the joint. Excision must then be practised in stages. It is necessary to excise first the skin wound and track in the soft tissues, then reflect the patella and excise the infected ligamentous tissue—usually the meniscus; and, finally, by a vertical incision down the lateral aspect of the head of the tibia, fully expose and chisel away the damaged portion of bone. This done the wound is completely closed in favourable cases, otherwise the bone cavity is dressed with bipp and packed with gauze, the end of the gauze being brought out and the rest of the wound closed in layers (see Case xx).

FIG. 4.—Comminuted patella, with wound and track excised *en masse* (Case vi). A, Lower portion of patella. B, Fragment of patella. C, Upper portion of patella, completely detached. D, Fat. E, Capsule. F, Skin, including wound. H, Patellar tendon.

When the patella is fractured the comminution is often so extensive as to call for complete removal along with the neighbouring infected tissue. The transverse incision employed for this operation should be made to include the external wound or wounds, so that such may be included in the excised mass. Obviously precaution must be taken to avoid cutting away any serous membrane or ligament beyond the margin of necessity; and even after exercising great care it is often found necessary to lengthen the quadriceps tendon when bringing the parts together again.

In minor fractures of the patella involving the articular surface, such as gutter wounds, or chipping or comminution limited to one side or end of the bone, the portion involved is excised *en masse* by means of a metacarpal saw. Occasionally a transverse fracture is met with and is treated in the same way, both fractured surfaces being sawn away. The fresh ends are then approximated by a purse-string suture of chromic gut round the circumference (see Case vi).

6. Irrigation of the Joint.

I invariably use normal saline, and prolong the process for several minutes so as to ensure a thorough mechanical cleansing of the joint.

7. Transplantation of Fat.

It has been proved that adipose tissue, when transplanted on to any raw surface, has the property of becoming adherent to it, with little reaction or alteration in its original size.² I have applied this practice to the knee-joint in the cleaner cases for filling up a hole in the articular surface. The infrapatellar pad of fat with the attached portion of synovial membrane is usually convenient, and I have found that such a pad inserted into the bony cavity acts also as a plug in arresting the oozing of blood.

8. Synovial Membrane.

It is now a recognized fact that when the knee-joint is given a fair chance it can deal with a mild infection, but not so the surrounding soft tissues; therefore it is important to close the joint completely and without tension. In order to do this, the lateral reflection of the synovial membrane has often to be loosened. Frequently, in dealing with a punched-out hole in the condyle, and particularly in case of doubtful asepsis, I have resorted to the following simple expedient for converting it into an extra-articular lesion: Beginning at the edge of the wound, the redundant synovial membrane is undermined from its attachments to the soft tissues and to the condyle all round the hole; it is then closed by suture, so as to exclude the bone lesion from the joint cavity. This is also done with wounds in the suprapatellar region.

Again, in rare cases, where the patella has been removed and the severely lacerated condition of the adjoining soft parts renders it absolutely necessary to close the true joint cavity, the whole of the synovial membrane from the suprapatellar pouch may be brought down and sutured to the synovialis below. A further lateral incision may be required to give access for this dissection.

9. Closure of Wound.

The wound is sutured in layers—the synovial membrane by a continuous suture of fine catgut, the capsule brought together by interrupted sutures, and the rest of the wound closed without drainage. In any case in which there is doubt as to complete absence of infected tissue, one or two Carrel's tubes are placed under the skin, in the hope of preventing sepsis. This, however, is seldom necessary.

The dressing is applied with a firm bandage and the tourniquet is then released. Finally the leg is put up in a Thomas splint.

ILLUSTRATIVE CASES.

The following series of twenty consecutive operations has been chosen because, thanks to the courtesy of medical officers at the base, I am able to give some account of the subsequent progress of all of them. In looking over the records of 50 consecutive cases (including this series of 20), I find that there were three deaths. Case xi was one of these; a second was due to septicaemia on the third day, and the third resulted from general sepsis due to multiple wounds. In only one case to my knowledge was a subsequent amputation necessary.

Many of these cases were operated on during periods of high pressure in the casualty clearing station and were transferred to the base within twenty-four hours with apparently no harmful results.

CASE I.

Pte. W., Canadian Infantry; rifle bullet wound, January 2nd, 1917, 11 p.m.

On admission there was a gutter wound across the middle of the patella with fracture; no effusion into the joint. I decided that it was a case to leave alone; the wound was cleansed and dressed, and the leg placed on a back splint.

Operation.

On January 3rd the wound was very septic, and the joint painful and tender. At 10 p.m. the patella was removed *en masse*; the joint, which contained semi-purulent fluid, was washed out with saline; the suprapatellar pouch was undermined, brought down and sutured to the synovialis below, thereby closing the true joint cavity; the quadriceps tendon was brought down and sutured, and the operation completed by closure of the capsule, and the wound without drainage. On the following day the area of the skin incision was red and inflamed; the stitches were removed and the parts treated by the Carrel-Dakin method. On January 8th there was slight superficial sepsis only, and on January 25th he was transferred to the base, the wound looking clean and healthy.

Base Report (a General Hospital).

Temperature normal since admission; wound healing rapidly; no joint infection. Transferred to England February 5th, 1917.

CASE II.

Cpl. B., Highlanders; wounded by shell fragment on January 6th, 1917, at 12.30 p.m.

On admission there was a small wound of entrance on the antero-internal aspect of the knee, with a large effusion into the joint. X rays showed two foreign bodies impacted in the inner head of the tibia. Multiple wounds of the leg were also present.

Operation.

The wound was excised and enlarged, the joint laid freely open, and the patellar tendon divided; both foreign bodies were removed, and the joint washed out with saline and completely closed without drainage. The wounds of the calf were laid open, infected and destroyed tissue was removed, and the post-tibial artery ligated; Carrel-Dakin treatment. He was transferred to the base on January 21st.

Base Report (a Canadian General Hospital).

Knee-joint looks well. Operation wound over front and internal part of knee-joint healed. Leg, large granulating wound, perfectly healthy. Transferred to England February 26th, 1917.

CASE III.

Pte. H., Cyclists Corps; wounded by shell fragment on January 8th, 1917, 9 p.m.

On admission it was seen that the missile had entered over the external condyle and traversed the suprapatellar pouch; X rays showed it lodged in the vastus internus muscle. There was a severe compound fracture of the middle third of the tibia of the same leg.

Operation.

At 10 p.m. the wound of entrance was excised and enlarged in the direction of the missile obliquely across the suprapatellar pouch and the joint laid widely open. No bony injury was found; the position of the wound of exit from the joint was noted to be at the top of the pouch; the skin incision was continued in this direction, and the wound in the synovialis along with the adjoining track and missile in the vastus internus excised *en masse*. The joint was washed out with saline, and the wound closed without drainage. The compound fracture of the tibia was treated by the Carrel-Dakin method.

On January 18th the knee-joint wound had healed by first intention; the stitches were removed, and he was transferred to the base.

Report from Base (a General Hospital).

Knee wound healed by first intention; no fluid in joint; result perfect. Leg wounds healing rapidly; a shell fragment found in subcutaneous pus pocket. Marked for England, February 5th, 1917.

CASE IV.

Pte. B.; wounded by shell fragment on February 5th, 1917.

On admission next day, through-and-through wounds on each side of the patella were found; both were dirty; x rays showed comminuted fracture of the patella.

Operation.

On February 6th a transverse elliptical incision was made and the patella removed completely, including the wounds of

from the suprapatellar pouch. The wound healed by first intention, and the stitches were removed on February 25th. When he was evacuated there was no joint infection.

No report was received from the base, but I heard from the patient that the wound was doing well.

CASE VI.

Lieut.-Col. M., Canadian Infantry; wounded February 22nd at 7 p.m. by a bomb.

On admission he presented multiple wounds of the knee-joint, and there was considerable loss of skin, with a large exposure of the antero-external surface of the joint. X rays showed a piece of metal impacted in a complete transverse fracture of the patella, also local injury to the external condyle and metal fragment higher up in the thigh.

Operation.

At 11.30 p.m. an oval incision including both wounds was made; infected tissue was excised with considerable difficulty in avoiding reinfection of the wound. The fractured patella was exposed, and by means of a metacarpal saw the upper and lower fractured surfaces were resected, leaving both ends with an even surface; the two portions were approximated by a purse-string suture. The injury to the condyle was next investigated, and a punched-out hole found communicating with the joint by a fissure through the articular surface; this injury had been produced by the foreign body seen by the x rays higher up in the thigh; the hole in the bone was

FIG. 5.—Case VI, before operation. A foreign body is impacted in the lower half of the fractured patella. The missile higher up produced a punched-out hole in the external condyle with a fissured fracture into the joint.

FIG. 6.—Case VI, after operation; shows also the fracture of internal condyle. This photograph, taken on the twelfth day, shows some separation of the patellar fragments.

FIG. 7.—Case VII: comminution of upper third of patella. Damaged bone excised, sawing from within outwards and well below infected tissue.

FIG. 8.—Case VIII: radiograph showing foreign body in internal condyle.

entrance and exit, *en masse*. Pieces of clothing were removed from the joint, and it was washed out with saline; the synovial membrane of the pouch was undermined, brought down, and sutured to the synovialis below; a flap of quadriceps tendon and vastus internus muscle was reflected downwards to close the gap completely, and finally the skin sutured without drainage.

On February 11th there was slight superficial skin sepsis; a few stitches were removed, and Carrel tubes placed underneath the skin. When transferred to the base on February 25th there was no joint infection.

Base Report (a Canadian General Hospital).

March 5th, 1917. Some pus from the wound in front of the joint. Carrel's tubes placed *in situ*. March 9th, 1917. Lateral incision inner side of joint; large cavity communicating with the wound in front; salt-packed. April 5th, 1917. Joint looks well, no pain, wound nearly healed. Transferred to England.

This pus pocket was apparently deep to the quadriceps, and was no doubt due to infection during the primary operation.

CASE V.

Pte. G., Canadian Infantry; wounded by shell fragment on February 13th, 1917, at 9.30 a.m.

On admission there was a wound of entrance only, on the top of the patella; the joint was very distended. X rays showed a foreign body in the joint, with fractured patella.

Operation.

At 4.30 p.m. on the same day a transverse incision was made, and the patella and wound removed *en masse*; the foreign body was lying loose in the joint; the quadriceps tendon and the capsule sutured. The wound was closed without drainage. In this instance the synovial membrane was not brought down

chiselled out, the joint washed out with saline, the synovialis was reflected laterally, loosened, and sutured, leaving the resulting cavity in the condyle extra-articular; finally, a plastic operation on the skin was done to effect closure of the wound.

On March 12th, when he was transferred to the base, the wound was healed by primary union; no joint infection.

Report from Base (a Canadian General Hospital).

Wound healed and looking clean; patient in good condition. Transferred to England March 26th, 1917.

CASE VII.

Pte. P., Canadian Infantry; wounded on March 1st, 1917, at 4.30 a.m., by a bomb.

On admission there was a through-and-through wound, the entrance over the external condyle, the exit above the patella. X rays showed the upper portion of the patella comminuted.

Operation.

At 2 p.m. an oval incision was made, including both wounds, which were excised in one piece with a portion of the quadriceps tendon; the upper third of the patella was resected, the joint washed out with saline, and the wound closed in layers.

He was transferred to the base on March 12th, the wound being healed by first intention.

Base Report (a Canadian General Hospital).

Treatment: Dry dressing; stitches removed. March 29th. Transferred to England in good condition, "for special orthopaedic treatment."

CASE VIII.

Pte. E., Fusiliers; wounded on March 8th, 1917, by shell fragment. Both knee-joints were penetrated; on the right there

was a through-and-through wound across the anterior surface of the knee; track running deep to the patellar tendon; the joint was very distended. On the left there was a wound of entrance only; x rays showed a large piece of metal impacted in the external condyle.

Operation.

On the same day both wounds on the right were excised, including a portion of the patellar tendon, in one mass; no bone injury was noted; the joint was washed out with saline, and completely closed. In the left knee the wound was excised and enlarged; the missile was located in the cancellous tissue, and cut clean out with a portion of the surrounding bone; the cavity was smeared with bipp, filled with a fat graft, and the joint completely closed.

Both wounds healed by first intention, and he was transferred to the base on March 18th.

Base Report.

Heard from the patient that he was doing well some weeks later.

CASE IX.

Pte. M., Field Coy. R.E.; wounded March 10th, 1917, by a rifle bullet.

On admission it was found that the bullet had entered the back of the calf, passing up through the head of the tibia; it could be felt underneath the skin just above and external to the patella; joint very distended.

Operation.

Arthrotomy was performed and the bullet removed; a fissured fracture of the head of the tibia was noted; the joint was washed out with saline and closed without drainage.

Base Report (Red Cross Hospital, Perth).

March 24th, 1917. Stitches removed. Wound healed and patient up on crutches. Transferred to Canadian General Hospital, London, April 26th, 1917.

CASE X.

Pte. A., Highlanders; wounded April 2nd, 1917, by bomb.

He presented on admission a through-and-through wound, passing under the patella. Synovial fluid was escaping from the wound.

Operation.

A crescent-shaped incision, convexity downwards, including the wound of exit and entrance in either horn, was made, the patella reflected upwards, and a transverse gutter fracture just above the articular surface of the femur excised; the synovial membrane was sutured over it, the joint irrigated with saline and closed. He was transferred to the base on April 3rd.

Base Report (a Canadian General Hospital).

A slight skin infection at one end of the wound, which cleared up in a few days. Sent to England.

CASE XI.

Pte. R., Highlanders, wounded on March 13th, 1917, by shell fragment, presented on admission a severe compound fracture of the right femur, and a large flesh wound over the antero-internal aspect of the left knee-joint; extensive destruction of skin and deep tissues exposed widely the surface of the joint; both wounds were very dirty.

Operation.

On March 14th the infected and damaged tissue of the knee-joint was freely excised. Bone was not injured; the joint was irrigated with saline bipp was smeared into the joint, and rubbed into the surrounding tissue; the synovial membrane alone was sutured. The fracture of the femur was treated by the Carrel-Dakin method. He was transferred to the base on March 16th.

Base Report (a General Hospital).

March 31st, 1917. Amputation of left leg. Sequestromy of femur.

April 6th, 1917. Died from sepsis. Post-mortem examination: fatty degeneration of kidney and liver.

FIG. 9.—Case xv.

CASE XII.

Pte. F. D., R.F.A.; wounded on April 2nd, 1917, by shell fragment.

There was a large wound of entrance only, situated over the external condyle; the joint cavity was freely exposed. X rays showed a large piece of metal impacted in the articular surface of the external condyle of the femur.

Operation.

The wound was excised and enlarged, the patella and tendon divided; the metal, with a portion of the surrounding bone, was cut clean out *en masse*; the joint was irrigated with saline and the cavity packed with gauze soaked in bipp; the end of the gauze was brought out and the rest of the wound closed in layers. He was transferred to the base on April 3rd.

Base Report (a Canadian General Hospital).

Gauze left in knee-joint for nine days before removing it. He had an infection localized to the track where the gauze was, but no general infection of the joint. His condition is good and the result should be a useful knee-joint.

CASE XIII.

Lieutenant M., Canadian Infantry; wounded on April 20th, 1917, by a shell fragment. The wound of entrance was on the top of the patella; there was no exit wound; there was a large effusion of blood into the joint. X rays showed a foreign body lying between the fragments of the patella, which was severely comminuted.

Operation.

On April 21st a transverse incision was made, the patella removed, and the joint irrigated with saline; the quadriceps tendon was lengthened and sutured, and the capsule and wound closed; a Carrel tube was placed underneath the skin; Dakin's solution was used every two hours. He was transferred to the base on April 23rd.

Base Report (a Red Cross Hospital).

This patient has done most awfully well; Carrel tube removed. Has never had any rise in temperature. Wound healed. Transferred to England.

CASE XIV.

Cpl. F.; wounded May 6th, 1917, by a bomb.

There was a wound of entrance only, internal to the patellar tendon. X rays showed a metal fragment in the joint cavity. There were multiple wounds also of legs, arms, and face.

Operation.

A crescent-shaped incision including the wound of entrance was made, and the patellar tendon partially divided. A foreign body lying loose in the joint was removed, and a gutter fracture of the inner border of the patella resected. The joint was washed out with saline, and the wound closed in layers. He was transferred to the base on May 7th, 1917.

Base Report (a Canadian General Hospital).

Treatment to knee nil. Patient sent to England, May 30th; no sign of joint infection.

CASE XV.

Pte. S., wounded by a bomb on May 9th, 1917.

presented on admission a wound of entrance only through the patellar tendon. X rays showed a large piece of metal in the joint; there was no effusion.

Operation.

A crescent-shaped skin incision was made and the wound and track excised, including a portion of the patellar tendon; the metal, which was lodged in the infrapatellar pad of fat, was removed and the site smeared with bipp. The tendon was sutured, and the capsule and wound closed. He was transferred to the base on June 10th.

Base Report (a Canadian General Hospital).

Progressing satisfactorily.

FIG. 10.—Case xviii. Radiograph taken after operation. Shows bipp in hole in external condyle, also size of cavity.

FIG. 11.—Thomas splint outfit for transport, with outer bandage removed to show method of application. Support is afforded to the limb by a ham splint, firmly padded under the popliteal space, and slung by a bandage at three points with two additional slings of adhesive plaster to prevent it shifting. Rotation of the leg is prevented by two lateral extension strips of gauze applied with glue solution and bound by a roller bandage. Only slight traction is necessary. Foot-drop is avoided by a third adhesive gauze applied from behind the heel, up the sole of the foot, and hitched to the crossbar of the foot-piece. General fixation of the limb is completed by a figure of eight bandage around the foot, which is continued upwards over all, including the anterior thigh splint.

CASE XVI.

Pte. S.; wounded by a bomb on May 13th, 1917. There was a wound of entrance on a level with the lower margin of the patella and internal to the tendon. X rays showed metal impacted in the inner head of the tibia.

Operation.

The wound and track were excised in a crescent-shaped skin incision; the patella was reflected upwards, and the comminuted lower tip resected; the foreign body was removed with a portion of the surrounding bone; the joint was irrigated with saline and completely closed. He was transferred to the base on May 16th, 1917.

Report from Base (a Red Cross Hospital).

Wound healed by primary union; most successful knee-joint operation. Evacuated May 30th.

CASE XVII.

Pte. C.; wounded on May 21st, 1917, by a bomb. On admission there was a large flesh wound involving the antero-internal aspect of the knee, with considerable loss of skin and deep tissue, exposing the joint cavity from the top of the suprapatellar pouch to the head of the tibia. X rays showed that a portion of the inner head of the tibia and internal condyle had been chipped off.

Operation.

The wound and infected tissue were excised, the internal meniscus removed, the cavity in the condyle and in the inner head of the tibia was cut clean out with a portion of the surrounding bone, and the joint irrigated with saline; the lateral attachment of the synovial membrane was loosened, rendering it possible to close the joint more or less; the hole in the tibia was dressed with bipp. The operation was completed by making a skin flap from the popliteal space and suturing it in position. He was transferred to the base on May 22nd, 1917.

Base Report (St. John Ambulance Brigade Hospital).

Wound healed by first intention. Raw surface at back has closed to such an extent as to render grafting needless; excellent result so far. To England June 28th.

CASE XVIII.

Second Lieut. H., Fusiliers, wounded June 6th, 1917, by shell fragment, was admitted with a large wound of entry over the external condyle. X rays showed a large piece of metal impacted in the condyle close to the anterior border.

Operation.

On June 7th the wound was excised and further enlarged; the foreign body, found impacted at a depth of half an inch in the condyle, was removed in the usual way; the joint was irrigated, the bone cavity smeared with bipp and filled with fat graft, and the wound closed in layers. He was transferred to base on the same day.

Base Reports.

From a General Hospital: Wound healed by first intention. Transferred to England June 14th. From 2nd Southern General Hospital, Bristol:—June 27th, 1917: Stitches removed; wound healed. Without a splint and doing well. (From the patient.)

CASE XIX.

Cpl. W. B.; wounded September 7th, 1917, by a bomb. There was a large through-and-through wound on the antero-external aspect of the knee-joint. Synovial fluid was escaping from the wound.

Operation.

The wounds of entrance and exit were excised in one piece; no injury to bone; the joint was washed out with saline and closed. He was transferred to the base on September 17th.

Base Report (a General Hospital).

October 6th. Wound healed by first intention. Transferred to England.

CASE XX.

Pte. J. T. A.; wounded October 5th, 1917, by shell fragment. The entrance was to the inner side of the patellar tendon and there was a large exit wound over the outer side of the head of the tibia; the wounds were very dirty. X rays showed severe comminution of the head of the tibia on its outer side.

Operation.

On June 6th the wound of entrance and the track in the soft tissues were excised by a crescent shaped skin incision, the patella was reflected, the external semilunar cartilage and infrapatellar pad of fat removed, and the head of the tibia then exposed by prolonging the excised exit wound vertically downwards; the damaged bone was removed *en masse*; the bone cavity was packed with bipp gauze, the joint washed out with saline, and the wound closed. He was transferred to the base on October 12th.

Report from Base (a Stationary Hospital).

October 18th, 1917. Knee-joint distended; purulent fluid withdrawn by needle; joint opened and Carrel tubes inserted.

Bipp plug to tibia. October 31st. Has cleared up, and there is now no discharge from the joint, though there is still a good deal from the hole in the tibia. Transferred to England.

[I desire to thank Colonel H. Gray, C.B., for much valuable advice on this subject. My thanks are also due to Lieut.-Colonel W. D. C. Kelly, D.S.O., for permission to publish these cases, and to Captain A. Campbell Haddon, R.A.M.C.(T.F.), for the drawings illustrating this article.]

THE KNEE-JOINT CAPSULE:

A RADIOGRAPHIC STUDY.

BY

F. RUPERT SNELL, M.B., B.S.,

CAPTAIN R.A.M.C.(T.C.).

It is not the purpose of this paper to refer to any of the points raised in recent articles by Colonel Sir A. W. Mayo-Robson and Major Keith Monsarrat on knee-joint injuries, but rather to show at a glance the salient and more obvious features of an injected normal knee-joint capsule, representing as it does an acutely inflamed, distended, synovial membrane which from a surgical point of view requires immediate interference. The minute anatomical detail has already been thoroughly dealt with by Colonel Andrew Fullerton, C.M.G.¹ Knowing, however, the difficulty of reproducing shadow contrasts in many x-ray photographs, it is hoped that these simple graphic drawings, made for me from the original skiagrams by Mr. Noel Leaver, A.R.C.A.Lond., will facilitate the grasping of the points at issue in discussions relating to the surgical treatment of knee-joint affections.

A direct antero-posterior view is shown in Fig. 1. In the first place there is to be noted the marked tendency to displacement well over to the outer side of the femur, and not to the inner, where it barely reaches the border of the bone; it shows also the distance it extends above the joint line, nearly five inches, and three inches above the patella; almost the entire outer condyle is covered by the overlapping capsule in front, whereas the inner condyle is very nearly free. The patella is seen in its normal position, much more over the outer than the inner condyle.

In Fig. 2 is shown a direct lateral view with the leg straight and lying on its outer side, thus bringing the inner side uppermost and nearest the plate. Here again it is manifest that the inner condyle is comparatively free from covering; the upward extension of the capsule three inches above the patella is shown, and also that it is slightly off the actual surface of the bone. The square-like upper border of the capsule is very marked, though this, of course, changes its shape on flexion.

The pouch underneath the patella averages about one fingerbreadth in thickness from the surface of the femur; but the most marked feature of this view is the extent to which the capsule is seen overlapping the inner surface of the shaft to nearly half the thickness of the bone. It is seen that in the popliteal space little more than the deepest part of the intercondylar notch is filled, and this only to the level of the upper intercondylar line; along the

Fig. 1.

head of the tibia the horizontally shaded portion represents the extent to which the upper and posterior portion of the head of the tibia is covered. The dotted line running from the top of the capsule from before backwards (through the vertically shaded portion) shows the extent to which the outer side of the shaft is overlapped.

Fig. 3 is from a skiagram taken with the knee in semi-flexion, but otherwise in the same position as in Fig. 2. This brings out the covering over the head of the tibia more forcibly in relation to the inner and posterior portion;

FIG. 2.

it shows also the little tongue of projection under the ligamentum patellae just where this overrides the head of the tibia; the most outstanding feature, however, is the marked extension of the capsule posteriorly, forming a large cushion-like pad more than filling the intercondylar notch, and even bulging out so far behind as to leave the posterior border of the outer condyle of the femur well in the background. This pad, however, is in relation with the inner aspect and not the outer.

The skiagrams were obtained by injection of the right knee-joint immediately after death, through the interosseous

space to the outer side of and about 1 inch above the insertion of the ligamentum patellae. No difficulty was experienced in introducing the emulsion with a 1 oz. glass serum syringe. The pressure required was no more than that to emit such an emission from the nozzle of the syringe, and as soon as the capsule was just tense no attempt was made to risk distortion by overdilatation; none of the emulsion escaped.

A dilute bismuth emulsion was used of the consistency of ordinary cream. It was carefully prepared by rubbing

FIG. 3.

up in a mortar, the following proportions being employed: Bismuth carbonate 5 iv. aq. dest. (slowly added) to 5 vi, compound tragacanth powder gr. xx. Great care was taken to ensure that the central ray was in the middle of the field in each case.

I am indebted to Captain Claude Horton, R.A.M.C., surgical specialist, for kindly carrying out the injection, also to Lieutenant P. W. Hampden, R.A.M.C., surgical specialist, for his collaboration in this report.

THE ABUSE OF DRAINAGE TUBES.

BY

FRANK HATHAWAY, M.D.,

SURGEON, KING EDWARD VII HOSPITAL, WINDSOR;
LATE CAPTAIN R.A.M.C.

SINCE I returned from France I have often been asked, even by intelligent members of our own profession, "What use is your experience of war surgery going to be in civil surgery?" These short notes are the answer, and are the experience of six months' civil surgery since my return from France.

War surgery, as is well known, is a very different thing now from what it was at the beginning of the war.

Now wounds of the head, chest, abdomen (even with faecal contamination), and knee and other joints are sewn up with impunity after early and complete operation, and the results are excellent.

These results are largely due to Colonel H. M. W. Gray, Consulting Surgeon, — Army, and to his devoted band of young and brilliant surgeons. One day the surgical world will realize what an enormous debt of gratitude it owes to Colonel Gray, and he will get the reward he deserves. It was he who first opened my eyes to the "abuse of drainage tubes," and it is his teaching I have applied to civil surgery.

He tells the story of a wounded man arriving at the base with over thirty separate wounds, into each of which a

drainage tube had been placed. What a waste of labour—to say nothing of rubber! The first and most important result of the war in the surgical world will be the abandonment once and for all of the drainage tube. Its day is past, and soon it will only be seen, where it should be, in a museum. When one seriously sits down to think, it is incredible that we have for years deliberately placed into the soft and pliable tissues of the human body a more or less rigid drainage tube with an open passage for secondary infection to creep down. They are well termed, for they are an open "drain in" for infection from outside, and an open "drain out" for the strongly antimicrobial fluids poured out around any infection.

Sir George Lenthal Cheatle grasped this fundamental fact when he introduced his solid drainage tube with flanges; but he still kept to the rigid design. For years it has always been taught that if there is the least infection in any part of the body "put in a drainage tube." This is a mistake.

If surgeons will take their courage in both hands and will not be frightened by a little infection, leaving it to be dealt with by the natural resistance of the tissues to infection, and will give up the use of drainage tubes, they will not only find their results very much better, but they will find their outlook on surgery totally changed. I have proved this for myself, and a complete revolution has taken place in my surgical work.

The first question is, "What is to replace a drainage

tube?" All that is necessary is to put something into the tissues which will keep a "passage" open but which does not leave an open "drain." If a passage is required to be kept open I put in a piece of soft folded rubber—for instance, in an appendix abscess. This allows pus to come away, but will not leave an open "drain" by which secondary infection of staphylococci, from the skin, or other organisms can gain entrance.

It will be noticed, when using a soft rubber "passage tube," that the exuding fluid completely fills the spaces left, leaving no open "drain." I find that, unless it is absolutely necessary, it is advisable to use even a "passage tube" as little as possible, but, whenever it is possible, to completely sew up the infected wound. The results are excellent. War surgery has therefore taught us what should be the two main principles of civil surgery:

1. Early and complete operation.
2. That secondary or mixed infection is worse than primary infection.

While the tissues of the body can, if given a fair chance, deal with one infection only, if that infection becomes a mixed one by entrance of organisms from outside, then the last state is worse than the first.

After all, it is only the application of our old methods of dealing with tuberculous infections to all other infections, and treating them on exactly similar lines—namely, free incision, evacuation of contents, cleansing by mechanical means, or by the use of an antiseptic, and primary suture.

It breaks my heart to see surgeons using fomentations and weak antiseptic baths in the treatment of wounds, for they simply encourage the staphylococci to come out of the pores of the skin and secondarily infect the wound.

It is interesting to note the steps by which I gave up the use of "drainage tubes" once for all. I came back from France with a dislike to them, and have only used them since on three occasions, once for a general peritonitis following appendix abscess and twice for empyemata. Always in other cases I have used "passage tubes" of folded rubber. Now I use the latter as seldom as I can, and completely close cases of empyema.

Applying my experience of modern war surgery I started sewing up ordinary staphylococcal abscesses of the subcutaneous tissues, after incision and wiping out with bipp, and found they healed by first intention. I next went a step further. I saw a case of perforated gastric ulcer two hours after perforation, and operated within four hours. I sewed up the perforation, and, as it was near the pylorus and tended to close it, did a gastro-enterostomy. I mechanically cleansed the peritoneum of food, washed out with flavine, and completely sutured. The result was healing by first intention and an uninterrupted recovery, better than I have experienced with the use of a drainage tube.

In these cases and others of perforated hollow organs, stomach or bowel, it is difficult to say which is the most important, mechanical or antiseptic cleansing. Personally I think mechanical, because the rubbing of the peritoneum with gauze produces a beneficial hyperaemia and transudation of lymph.

Then I had to treat a bad compound fracture of tibia and fibula with a large external and contused wound, in a boy who had been run over by a motor lorry. I excised well clear of all damaged tissues—wiped out with bipp, and so mechanically cleansed and closed the whole wound by primary suture. The result was healing by first intention without a trace of suppuration.

The next step forward was in a case of gonococcal peritonitis. I found the peritoneum infected and containing a turbid fluid; I removed one Fallopian tube full of thick gonococcal pus, cleansed the peritoneum mechanically, washed out with flavine, and closed without drainage. The result was uninterrupted recovery and healing by first intention.

As to this case, I realize that it is the practice of many surgeons not to drain in gonococcal peritonitis, and that the fluid passed out by the peritoneum is frequently sterile, but I quote it because I myself, before my experience of modern war surgery, would have drained it for fear of infection, and I am sure other surgeons are "putting in a drainage tube to be on the safe side."

Why should we drain an empyema, where, by the putting in of a drainage tube, we not only run the risk of secondary infection but of collapse of the lung with its sequelae?

A case of empyema following a very severe attack of pneumonia occurred in a man very debilitated and ill, so that it was hardly thought he would live. I excised a piece of rib under a local anaesthetic and made a small incision into the pleura. At once he coughed out a large amount of thick fibrinous exudate. When he emptied his pleura I washed out with flavine and injected about a pint of a suspension of iodoform in paraffin, and sewed up from the pleura and then the skin. His general condition at once improved, the pulse and temperature gradually dropped, and I am quite certain he has made a better recovery than with an open "drainage tube."

The only drawback I found, and that was a small one, was that occasionally a small amount of pneumococcal pus and iodoform paraffin collected between the pleura and skin in the dead space left by the removal of a rib, and required evacuation. Only once did his temperature rise to 100°, but the pulse came steadily down from 120 to 74. He is now very well, and my friend Dr. Elgood, the physician who pulled him through his pneumonia, and I are very pleased with him. Four weeks after the operation the lung had expanded well.

By this method of treating empyema the risks of massive collapse of the lung and of secondary infection are both avoided and the convalescence is shortened.

I must confess to one failure, if it can be called so:

A child was sent into hospital with a diagnosis of appendicitis. I found general peritonitis with much thickened lymph covering the intestine. The appendix was normal, and no other cause was found. A swab taken was found to be sterile, but no doubt it was a case of pneumococcal peritonitis. I found too much exudate and flaky lymph to attempt mechanically to cleanse the whole of the intestines, which were covered in fibrinous deposit. I washed out with flavine and completely closed the abdomen. The child did very well, the abdomen was quite soft, the bowels acted well, and there was no vomiting. Suddenly on the fifth day the child became worse, and Dr. Elgood, who was in the hospital at the time and saw her, diagnosed pneumonia, and she died before I could be found. Unfortunately no *post-mortem* examination was allowed, but I have no doubt that the child died from a lung complication, and not from the abdominal condition.

A method of treatment in bone surgery which I was beginning to employ in France was founded on the idea of eradicating the "dead space" in a bone following the loss of substance by a gunshot wound or by an operation for infection. My idea was that where a dead space or open cavity was left in a bone by destruction it should be filled, not by blood clots, allowing a nidus for primary or secondary infection, but by an antiseptic wax which could be poured in hot, and would gradually cool and fill up any cavity. I did this on three occasions with excellent results, using a compound of thymol, vaseline, and candle-wax, which I found would become semi-solid at normal body temperature.

The first case was a wound of the upper arm with much destruction of the upper end of the humerus. By early and complete operation I removed many fragments and found a large cavity in the bone. This I filled with thymol wax and carried out primary suture. The compound fracture of the humerus healed by first intention and the result was very good, although a certain amount of thymol wax was exuded for a time through the stitches. I also carried out this treatment for a through-and-through gunshot wound of the ankle where the head of the astragalus was completely gone. The wound healed by first intention without, in this case, any exudation of wax.

I used this treatment as a secondary measure in a compound fracture of tibia with a big hole in the bone. As the wound was clean I poured in thymol wax and filled the cavity and performed a secondary suture; the wound at once healed. I have had no opportunity of applying the method in civil surgery, but in osteomyelitis of the tibia, for example, I should completely lay the medullary cavity open, thoroughly scrape away the infected medulla, fill up the "dead space" with thymol wax, and carry out primary suture. I feel sure the result would be better than by laying the bone open and allowing the wound to heal by granulation.

Conclusion.

In order to avoid mixed infections surgeons must practise primary suture far more than in the past, and completely give up the use of rigid open drainage tubes.

Instead of draining where there is infection I advise going to the opposite extreme, and not to leave a "passage" open unless it is absolutely necessary.

If a secondary abscess or leakage from bowel should occur it will be dealt with by the inherent resistance of the body to infection, or should an abscess form it can be treated by a second operation, after adhesions have formed.

A new epoch in surgery will dawn when surgeons realize, as I have done, that they can leave quite a large amount of infection to be dealt with by the inherent resistance of the body to infection.

These notes are written with the sole object of stimulating my seniors and contemporaries who have more material to carry out the lines I have suggested, and to more and more practise primary suture in their cases, and above all to give up once and for all the use of open rigid drainage tubes.

Sr Bertrand Dawson, G.C.V.O., has kindly added the following note on the treatment of streptococcal empyemata:

With regard to empyemata, my experience is that the pneumococcal ones do well with immediate closure after evacuation, but not the streptococcal. These latter need to be drained for two or three days, with or without Carrel tubes, and then they can be sewn up.

I agree that streptococcal infections must be dealt with on different lines from staphylococcal, pneumococcal, and other infections, but in civil practice it is very rare to meet with streptococcal empyema.

ANOMALOUS MUSCULAR ACTION IN NERVE INJURIES.

By D. M. HUGHES, M.B., F.R.C.S., MAJOR R.A.M.C.,
OFFICER IN CHARGE OF SURGICAL DIVISION, EDMONTON
MILITARY HOSPITAL.

THE precise action of an individual muscle is not always easy to determine in the uninjured limb, since a particular movement is in most cases brought about by the resultant action of many muscles and not by one alone. When a nerve trunk is severed and the muscles supplied by it are put out of action, the muscles supplied by the uninjured nerves of the same region sometimes give rise to surprising movements. It is probable, in fact, that the movement resulting in these cases is such as never occurs in a limb with properly balanced muscles. While this movement is in many cases of mere academic interest, it occasionally happens that it may flatter the surgeon who has performed a nerve suture, giving him the impression that muscular recovery has begun, whereas an attentive examination of the muscles causing the movement may show that his conclusion is premature.

One of the most striking instances of this that have come under my notice is that when the median and ulnar nerves are divided in the upper arm, active flexion of the wrist is often still present, being brought about by the extensor ossis metacarpi pollicis. Another anomaly is seen in posterior interosseous paralysis, namely, the first dorsal interosseous muscle can cause a lifting of the thumb easily confused with commencing recovery of extension of that digit. These two anomalous movements clearly depend upon the difference of the plane in which the metacarpal bone of the thumb lies relatively to the plane of the four remaining metacarpals.

Other unexpected actions are that the terminal phalanx of the thumb can be actively extended in cases of posterior interosseous paralysis, the extension of course being brought about by the insertion of the abductor pollicis into the dorsal expansion of the extensor tendon; and that in ulnar paralysis the index finger can be slightly abducted by the obliquity of the extensor tendons passing to that digit. In persistent paralysis these movements, aided by use, massage, and electrical stimulation, may acquire some importance.

Some of these unsuspected muscle actions, it is true, may indicate merely that one's memory for anatomical detail requires furnishing, and anatomists could doubtless furnish many more instances. There is no doubt, however, that a partially paralysed limb offers a rich field for the investigation of the essential action of individual muscles.

Another anomaly which may often be observed is due to the general preponderance of the flexor muscles. This is seen in its most marked form in lesions of the upper motor neuron—for example, in a case of hemiplegia. If the wrist of such a patient is passively extended, the fingers curl into the palm and exercise a quite perceptible grip. In a lower motor neuron paralysis—for example, in complete lesion of the median and ulnar nerves in the upper arm—this action is also observable, though it is not so evident, and may give rise to a false notion that

recovery of active flexion of the fingers is in progress. In some cases it certainly indicates that the elasticity, and therefore the nutrition, of the finger-flexors is being maintained, but in others it points to essential fibrosis and shortening of those muscles, and is consequently of grave significance. In the latter case it usually betrays neglect of treatment. If the fingers can be straightened only while the wrist is flexed this condition of fibrosis is present in the flexors of the fingers. In a most helpful paper Professor Langley¹ has shown that the danger of stretching a paralysed muscle has been somewhat overstated. It is questionable, at any rate, whether it is preferable to risk stretching the muscles or to encounter a case of musculo-spiral paralysis so assiduously treated on a "cock-up" splint that the wrist, by reason of fibrosis of the extensors, could be brought neither up nor down.

It is surprising, again, to find what little muscular disability may result from complete division of the median nerve at the wrist. In a case recently operated upon there was, except for most intractable trophic ulcers over the median distribution in the hand, which was completely anaesthetic, practically no disability, and the lesion might easily have been overlooked. The abductor pollicis was completely paralysed and its situation represented by a fossa on the radial side of the metacarpal bone, but the loss of this muscle seemed not to affect the utility of the thumb. As for the movement of opposition, this was quite efficiently carried out by the adductores pollicis in combination with the long and short flexors, both heads of the latter appearing to be active in spite of the complete division of the nerve an inch above the wrist. It is interesting to note that within a month the trophic ulcers healed for the first time, but there was still complete trophic loss. This may only indicate, however, that the hand had received better protection after the operation than it had previously obtained.

Cases such as this are of interest from the ease with which nerve lesions may be overlooked, as pointed out by Mr. T. E. Hammond² in the case of the internal popliteal. They also illustrate the point that if a nerve is sutured without a previous careful examination of both muscular and sensory loss, the operator may claim results to which he is not entitled. This may account for some cases of atypically early recovery after nerve suture.

EARLY CARDIAC BREATHLESSNESS AND "BUFFER-SALT" DEFICIENCY IN THE BLOOD.

By BENJAMIN MOORE, D.Sc., F.R.S.,

DEPARTMENT OF APPLIED PHYSIOLOGY, MEDICAL RESEARCH COMMITTEE.

THE review in the *JOURNAL* of June 22nd (pp. 702-4) of the report of Dr. Lewis dealing with the causation of breathlessness on exertion in early cardiac cases is most interesting, but may I be allowed to point out that the expression "buffer salts," first coined in Germany for an effect described and measured originally in Britain, conveys an erroneous impression, because the protective action against variations in acidity or alkalinity is due not to the inorganic salts, carbonates, or phosphates, of the plasma, but almost in its entirety to the amphoteric proteins?

This protective action was fully described, and a quantitative method supplied for its estimation, by the writer and his colleagues Roaf, Wilson, and Whitley at the biochemical laboratory of the University of Liverpool over a decade ago, the results being published in the *Proceedings of the Royal Society* and the *Bio-chemical Journal*.¹

The action was described under the title of the "reactivity of the serum," as distinct from the "reaction of the serum" at any given moment, and by estimating the amount of decinormal alkali and acid necessary to titrate from one definite value of hydrogen ion concentration to another, marked by the mid-point or neutral point to two coloured indicators, namely, phenolphthalein and methyl orange, there was assigned a quantitative value to the "reactivity" or protective power of the blood and tissue

fluids. This had to pass to the Continent and be re-dubbed the "buffer-salt effect" before receiving attention, and even now these earlier papers seem to be unknown to British workers on the subject, although their results would well repay a little consideration.

For example, the expression "buffer-salt" is quite misleading; the effect is not due to salts, for the very sufficient reason that there does not exist a sufficient quantity of sodium carbonates and phosphates in the plasma *in toto* to account for one-tenth of the protective influence, or to carry one-quarter of the carbon dioxide found in arterial blood. Salts cannot protect which are not there, and at least 90 per cent. of the protective action is due to the plasma proteins.

A most important point brought out by this earlier work which appears to have been quite forgotten is that all the inorganic salts of the plasma, including even the sodium chloride, are held in union by the proteins. It is this union which regulates the amount of salt in the blood with such a delicate precision. The excretory cells allow no excess of free salt in the circulating plasma, and it is this combining power of the proteins for salts which determines the value of physiologically "normal saline."

If the molecular concentration of mammalian serum be determined from the depression of its freezing point it will be found to be approximately equivalent to that of a one-sixth molecular solution of sodium chloride. If, now, the same serum be titrated with standard acid till neutral to an indicator such as methyl orange, and then with standard alkali till neutral to phenolphthalein, the range will again be found equivalent to a one-sixth molecular solution. Outside these two marginal limits very small additions of acid or alkali swing up or down the hydrogen ion concentration with enormous speed; within the limits large additions of acid or alkali produce only moderate effects.

Within these viable limits, marked out by the titratable value of the proteins, variations by accumulation of organic acids and alkali and carbon dioxide occur in varying conditions of health and disease, and the neuro-muscular and cardiac system may be chronically fatigued by such products. The soldiers investigated by Dr. Lewis may owe their condition to the strain of neuro-muscular fatigue induced by a physical training for which they are unfitted by nature. Apart from military training, the prolonged strain of war conditions is producing such an action on many people in civil life. Breathlessness, accompanied by disordered heart rhythm, is a prominent symptom, especially after any prolonged neuro-muscular exertion, in many persons bordering upon neurasthenia at the present time.

A variation in the balance of "reactivity" of the blood may also be present in the different forms of "shock." It has been shown by Roaf and Adamson that the serum proteins completely lose their osmotic pressure when acid is added to the serum till the equi-potential point or point of physico-chemical neutrality is reached. Bayliss has recently shown that colloids such as gum acacia or gelatine, which were demonstrated by the earlier work of Moore and Roaf to have a high osmotic pressure, possess the property of maintaining for much longer periods than purely saline solutions a higher blood pressure under shock conditions.

These and kindred problems are intimately connected with that protective mechanism in the blood plasma first described and measured in Britain under the term of "reactivity of the serum," and later reintroduced from Germany under the name of "Puffer-salzen" or "buffer effect."

CARDIOPTOSIS.

BY

W. GORDON, M.D., F.R.C.P.,

PHYSICIAN, DEVON AND EXETER HOSPITAL.

I AM not sure whether the term "cardiopsis" has yet found its way into cardiology. I do not remember coming across it, and it is not in any of my textbooks. Yet I am sure the term would serve a useful purpose in focussing attention on a condition not unlikely (as in one instance here related) to be misinterpreted. The condition, of

which I can only speak from the clinical standpoint and from my limited experience, would appear to be one of undue laxity of the cardiac supports, such that, whilst the apex beat in recumbency is found about the normal position, in the fifth space, in the erect position it is located just below this, in the sixth space, without any evidence of other causes to account for the displacement.

In the first of the two following cases there was no sign of enlargement of the heart, although "enlarged heart" had been diagnosed, partly from the position of the apex beat in the sixth space; and in this case the dropped heart was associated with an obviously dropped kidney and a probably dropped stomach. In the second case there was moderate cardiac enlargement, although not so great as to seem to account for such a displacement of the apex beat in the erect position; a palpable spleen with normal temperature and no obvious blood changes in a fresh film, suggested in this second case a dropped spleen, but this could not be certainly diagnosed in the limited time at my disposal.

CASE I.

M. E., aged 21, suffered from attacks of "faintness," not, however, going to complete unconsciousness. He had had diphtheria badly at 1½ years old, followed by "paralysis of hands and feet," and could not walk till 3. He had had double pneumonia at 11 and a bad fall at 17; he had also been physically overworked, I think.

The chest was slightly deformed, the third and fourth rib cartilages on both sides being unduly prominent at their sternal junctions. Urine, lungs, and reflexes were normal. There was marked nephroptosis on the right side, and the lower border of the stomach (which seemed, however, to be somewhat dilated) was close to the umbilicus. He was supposed to have "enlarged heart," but my examination gave the following results: In the erect position the cardiac dullness reached from the mid-sternal line only ½ in. rightwards and 3½ in. leftwards. The apex beat was quite obviously in the sixth left space, 3½ in. from the mid-line of the sternum. In the recumbent position the right margin of dullness was at the mid-sternum and reached leftwards 3 in. The apex beat in recumbency was obviously in the fifth space at about the edge of the dullness. There was no murmur in the recumbent position, but in the erect position a very local short systolic murmur was heard 1 in. outside the apex beat during inspiration only, being completely lost during sustained expiration.

CASE II.

J. S., 48, complained of weakness and occasional shortness of breath, had considerable rheumatoid arthritis, and was more or less a chronic invalid.

In the erect position the cardiac dullness reached rightwards to mid-sternum and leftwards to the left mammary line, 4 in. from mid-sternum; upwards to the fourth rib. The apex beat was unmistakably in the sixth space. In the recumbent position the dullness was, as usual, narrower, but reached as high as the third rib. The apex beat was definitely in the fifth space inside the left mammary line.

There was a systolic murmur, heard in both positions, louder after exertion and unaffected by respiration, where the fifth rib cartilage joined the sternum. Urine, lungs, and reflexes were normal. In the abdomen the splenic edge descended on inspiration about a fingerbreadth below the left ribs. The blood in fresh film seemed normal and the temperature was normal.

THRESHOLD TESTS.

MUCH is to be learnt by investigating the thresholds for light and colour. Finding by routine examination that a normal standard, quite as uniform as that for visual acuity, exists, I have recently attempted to standardize a series of test objects which can be universally used for determining how near to, or how far from, the normal standard each individual eye is. In diseases of the retina, the choroid, and the optic nerve, very remarkable variations from the normal are found. But I have reason to believe that abnormal thresholds are not limited to diseases of the eye; marked changes in the thresholds are certainly to be found where the ocular implication is secondary. Thus, working with my test, my colleague, Dr. Walter Sinclair of Ipswich, pointed out that in several of his cases of retinitis of pregnancy the threshold for yellow was the only one attacked, but that very considerably. I found the same in the only case I have seen since. The threshold for yellow was reduced to recognition of the dilution 1 in ½, instead of the normal 1 in 32.

Though this can be no more than a hypothesis, I suggest that those who are not limited, like myself, to ophthalmic

practice should search all cases for a while with the view of ascertaining whether there be any cases in which reduction of the threshold proves to be the only ocular symptom.

An account of the test and of some of the work done so far on this subject will appear shortly in the *British Journal of Ophthalmology*.*

I give here a brief explanation of what is meant by the thresholds.

The Threshold for Light.

If in a railway train we pass through a long tunnel and there is complete darkness, even after adaptation, we notice on approaching the exit a moment when the first glimmer of light is perceived. This is the threshold for light. A patient whose light sense was reduced would not perceive light till some time after we did.

The Threshold for Light Differences.

The stars are always in the sky, but we only see them after sunset, because though there is a difference in light intensity between them and the sky, even in daylight, there is not sufficient difference for the human eye to distinguish them. The threshold for differences of light intensity is reached the moment the evening star becomes visible, or the instant the morning star fades out of sight. We would distinguish the evening star sooner than our friend in the train, and would still see the morning star after it had vanished for him. I find that when the threshold for light is reduced, that for light differences is equally so. A test of the latter is incomparably more simple, and for all practical purposes sufficient. It becomes practically a measure of the light sense.

The Threshold for Colours.

These thresholds are quite distinct from both the previous ones. They are indicated by the very first tints perceivable in the clouds when we watch the horizon at dawn, and the very last trace of colour in the sunset clouds before all is grey.

That the periphery of the retina is more sensitive to these thresholds is easily observed by watching the Pleiades. If a point more or less remote from this group be fixed on the sky, a far greater number of its stars evoke our light sense than if the group itself be fixed.

The point to decide is, whether these thresholds have any clinical value for diagnosis, differential diagnosis, or prognosis.

Colchester.

GEORGE YOUNG, M.D.

A CASE OF TETANUS NEONATORUM.

TETANUS NEONATORUM is so rare in this country that the notes of the following case, the only one I have met with, may prove to be of interest.

On April 1st, 1918, I was called to see a male child, nine days old, who was said to have been crying all day, and had not taken the breast. The mother, a young primipara, had been attended by a certified midwife, who reported that labour was normal in every way. The mother had made a good recovery. I found the baby on the nurse's knee, crying loudly. Instead of opening its mouth fully, however, there was scarcely half an inch of separation between the jaws. An attempt to increase the opening with the finger failed, and it was only after force strong enough to bend a spoon had been employed that the attempt was abandoned.

The jaw was indeed locked. The mouth and throat, so far as could be determined, were healthy. The umbilical scar was sloughing and from it exuded a moderate amount of thick pus. Around the umbilicus there was a band of inflammation about an inch in breadth, dusky red in colour. A diagnosis of tetanus was made and a bad prognosis given.

On April 2nd the child presented all the classical signs

of tetanus. The jaw was fixed and the angles of the mouth drawn upwards. The arms were flexed at the elbows and rigid, and the hands clenched. The legs were fully extended and rigid. The head was firmly retracted to a moderate extent and the body was in a position of opisthotonos. Tetanic convulsions were frequent and were excited by shaking the child and by other stimulation. There was no muscular retraction between the spasms. The child died the next day.

A swab was taken from the pus which exuded from the umbilical scar and microscopic slides were prepared. The pathologist (Dr. Burnet) reported that the slides contained numerous cocci, diplococci, and diphtheroid bacilli, with other bacilli, but no tetanus organisms. Culture of the swab failed to produce any tetanus organisms, but there were numerous cocci and bacilli of the *Bacillus coli* type. Although the failure to establish the presence of the tetanus organism would seem to introduce an element of doubt, yet the symptoms were so typical as to preclude an error of diagnosis.

During a moderately long experience of midwifery in general practice I have been much impressed by the rough and ready methods employed during the act of separation of the child. It is quite usual for the midwife to ligature the cord with strong cotton which has not been sterilized. The scissors, moreover, are rarely boiled; in fact, no attempt whatever is made to prevent sepsis. With this fact in view it seems strange that one does not meet with more cases of a similar nature to that reported. The cases of umbilical hernia, so common in the young child, may be due to sepsis with consequent stretching of the scar, the result of bad treatment of the cord at birth. Prolonged jaundice occurring in the first days of infant life is due, I believe, in a large number of cases to a similar cause. It should be the bounden duty of those who teach the fundamental principles of obstetrics to nurses and midwives to instruct them that although the umbilical cord becomes separated by a process of gangrene, it nevertheless requires as much cleanliness and care in its treatment as though one were dealing with a healthy tissue.

Doncaster.

HAROLD F. RENTON, M.D., B.S.Lond.

ECTOPIC GESTATION: A CASE OF TWINS IN ONE GESTATION SAC OF TUBAL ORIGIN.

A MARRIED Frenchwoman of some twenty-two years was admitted into Founder Ward, Middlesex Hospital, in the summer of 1913, suffering from an acute abdominal condition, and in the absence of my senior colleague, Sir John Bland-Sutton, I was asked to operate. Her condition and the history were such as to suggest a severe abdominal haemorrhage, probably of pelvic origin. She had been married two or three years, had no children, and there was a history of a missed "period," followed by an acute attack of pain some days before admission, and then the violent catastrophe which brought her for immediate relief to the hospital in a desperate condition.

A median subumbilical incision revealed the presence of about four or five pints of blood in the peritoneal cavity, and an investigation of the source of the haemorrhage revealed a large mass of clot projecting from the posterior surface of the right broad ligament. The right tube was swollen, and had been the site of the primary gestation sac, which had undergone an intraligamentous rupture; the secondary sac had formed in the right broad ligament, and this had in turn given way. The attack of pain ten days before admission doubtless corresponded to the rupture of the primary gestation sac, and it was the rupture of the secondary sac which produced the alarming symptoms from which the woman was now suffering. In the blood clot between the layers of the right broad ligament, and extruding from the rent, were found a complete embryo in good condition, and the head and shoulders of a second one. They were handed over to the anatomical department, and Dr. R. J. Gladstone kindly informs me that the intact embryo had a length of 32 mm. There was no flaw upon the complete fetus to suggest that the second head and shoulders were a part of some monstrous form, and the portion of the second embryo present was perfect in so far as it existed. Search of the blood clot failed to discover the remainder of the twin. Considerable difficulty

* A very handy test, in album form, is obtainable from Messrs. John Weiss and Son, 237, Oxford Street, by means of which each eye separately is tested in a minute. On the patient's part it requires no understanding and very little intelligence. The album contains series of graduated spots of grey and four colours. The palest grey recognized gives a measure of the light threshold; the palest colour spot in each series which evokes a true sensation of colour, irrespective of the name given to it, gives a measure of the colour thresholds. Both are approximate, but suffice.

was experienced in controlling the hæmorrhage from the placental site on the lateral border of the uterus, and a series of mattress sutures was required to secure this.

The sequel was tragic, since a fortnight later the patient suddenly developed acute intestinal obstruction, which on operation was found to be due to a coil of small intestine that had become adherent to the bottom of the pelvis in the region of the former placental attachment to the side of the womb. The coil was released, and it was hoped that the condition would be thereby relieved, but the bowel failed to empty itself, and a jejunostomy was performed. This vent relieved the urgent symptoms, but all later efforts to close the opening failed and the patient rapidly lost strength and finally died of inanition.

The case has several features of interest. First, the condition of twins in a single gestation sac must be exceedingly rare; although I have no present access to any literature, I am aware that the condition is not unique. Secondly, it is probable that the performance of hysterectomy for the bleeding from the side of the uterus instead of the laborious insertion of mattress suture after mattress suture would have obviated the acute obstruction from which the patient died, but the condition of the patient at the time of the original operation must be borne in mind. Thirdly, the vivid manner in which this little Frenchwoman's death still remains indelibly fixed in my mind is a criterion of the almost uniformly certain aid that surgery can bring to luckless sufferers from an ectopic pregnancy.

Rebuelus.

THE ROTUNDA HOSPITAL.

THE history of the famous lying-in hospital of Dublin has been written by Dr. KIRKPATRICK, the historian of the medical school in Trinity College, and the book has been edited by Dr. HENRY JELLETT, the late distinguished Master.¹ The collaboration of these two physicians represents a union of historical research with first-hand knowledge which gives special value to their work. A long article was ready for the press when the war broke out and at once reduced the space available for historical matter to vanishing quantity. The curtailed form in which the review now appears is not due to any lack of appreciation of the importance of the work but to conditions of publication over which we have no control.

When Bartholomew Mosse, the founder of the Rotunda, began to practise in Dublin there was no lying-in hospital in Ireland or Great Britain. It was a bold undertaking for a man of barely 33 and with no practical experience of hospital management to embark on such an enterprise. None of his professional brethren came forward to help, and some actively opposed him. Mosse, nothing daunted, formed a "union of a number of persons of different occupations, most of whom subscribed four shillings and fourpence yearly to be paid quarterly for the support of the intended hospital." With this small promise and what money he could spare from his own slender means he took a house which had been a theatre, and it was opened as a hospital in March, 1745; before November 1st, 1747, 509 women had been delivered in it of 522 children. In the endeavour to provide money for his foundation, Mosse had become deeply involved in financial speculations, and was at least once arrested for debt. Nevertheless, in 1748, he bought a site of more than four acres in what was then a suburb. On part of this space he proposed to build a hospital with accommodation for at least 150 patients; the rest was to be laid out as public gardens to be used for entertainments, the profits of which were to go towards the maintenance of the hospital. On July 9th, 1751, the foundation stone of the new building was laid by the Lord Mayor of Dublin. Mosse was anxious that the new

hospital should be a national institution, and in 1752 the required authority was obtained for incorporating the "governors and guardians of the hospital for the relief of poor lying-in women in Dublin." Among the first governors were the Lord Lieutenant, the Archbishop of Armagh, the Lord Chancellor, the Speaker of the House of Commons, the Lord Mayor of Dublin, and a number of other persons of high social standing. Mosse, who was the first Master, applied in 1755 to the Irish Parliament for financial aid, grounding his petition on the work done in the old hospital, where, from the date of its opening to September 30th, 1755, 3,674 women had been delivered of 3,746 children. It was urged that, in addition to the help given to poor women, the hospital had made it unnecessary for medical students to go to France or other foreign parts for instruction and experience in obstetrics, and that midwives also were taught. In 1755 a charter was granted by George II, and the hospital was opened by the Lord Mayor. On February 16th, 1759, Mosse died in the 47th year of his age, having carried his scheme to fulfilment in the face of many difficulties.

The subsequent history of the Rotunda is one of progress chequered by financial and other difficulties. Mosse was succeeded in the Mastership by Sir Fielding Ould, who is said to have officiated at the birth of the Duke of Wellington. In 1764 it was decided that a sum of £3,000 granted by Parliament should be laid out in building a large room in the waste ground of the hospital gardens. This room, from its shape, was called the Rotunda, and from this the hospital got the name by which it is universally known. It was let for oratories, receptions, and similar purposes. In 1770 it was decided that systematic instruction in midwifery should be given at the hospital, and Mosse's creation grew into a Mecca of midwifery to which students flocked from the ends of the earth.

We wish we could follow Dr. Kirkpatrick in his fascinating narrative of the vicissitudes of the Rotunda; the story is full of human as well as scientific interest. In 1835 a gynaecological department was established. In 1838 Every Kennedy, then Master, formed an association among his students to which he gave the name of the Dublin Obstetrical Society. This was soon joined by a large number of practitioners, and it continued in active life till 1882, when it was merged with the other Dublin societies into the Academy of Medicine.

More than once the existence of the hospital was threatened. Recurrent outbreaks of puerperal fever exposed it to severe criticism, and in 1867 Every Kennedy informed the Governors that it had ceased to fulfil its purpose, owing, he argued, to the fact that the congregation of a number of lying-in women under one roof engendered and spread among them "a disease *sui generis* and of the most fatal character." His view was not accepted, but he returned to the charge in a paper read before the Dublin Obstetrical Society in 1869. This was followed by a debate which revealed the fact that of the seventeen speakers who took part in it not one had grasped the importance of the work done by Semmelweis. But Lister was about to bring in a new era. Louisa Atthill, who became Master in 1875, made an attempt to apply the principle of antisepsis. This was done in a more thoroughgoing manner by his successor, Arthur Vernon Macan. It would be difficult, says Dr. Kirkpatrick, to say too much in praise of Macan for the work he did while he was Master. If Mosse built the hospital, Macan saved it from extinction.

Under Sir William Smyly, Dr. Purefoy, and Dr. Jellet, the hospital not only maintained its position, but gained an even wider reputation than it had before. The part each of them played is left by Dr. Kirkpatrick to some future historian to record. Special mention should, however, be made of the successful efforts of Dr. Jellet to save the Rotunda from the doom with which its school of midwifery was threatened by the Insurance Act.

A word must be said of the fine illustrations with which the book is abundantly supplied. They show the growth of the Rotunda from the now dilapidated house in which it began its work to the stately edifice in which its beneficial activity is continued. Both the author and the editor of this handsome work may be congratulated on having raised a monument worthy of the famous institution whose origin and development are traced in an eminently readable style.

¹ *The Book of the Rotunda Hospital.* An illustrated history of the Dublin Lying-in Hospital from its foundation in 1745 to the present time. By T. Percy C. Kirkpatrick, M.D., M.R.I.A., Fellow and Registrar of the Royal College of Physicians of Ireland. Edited by Henry Jellet, M.D., F.R.C.P.I., Master of the Hospital. London: Adlard and Son, Bartholomew Press, Bartholomew Close, E.C. 1913.

THYROID AND THYMUS.

As an example of the bookmaker's handiwork this sumptuous volume, *Thyroid and Thymus*,² merits high praise—paper, type, binding, and illustrations are of the first order. The regret is great when a rich setting is employed to show off a stone badly cut, and not of the highest quality; it becomes greater when it is recognized that with reasonable care the grave defects could have been remedied.

As first assistant to Professor Stilling, in the Pathological Institute at Lausanne, and later under Professor Kocher at Berne, Dr. CROTTI has had opportunities of familiarizing himself thoroughly with the pathology and surgery of the thyroid. Every chapter shows an intimate knowledge of his subject, more particularly, as is natural, of the observations and views of Swiss workers. These are very fully stated—sometimes too fully, as, for example, the discarded hydrotelluric and plutonic theories, of Bircher and Repin respectively, upon endemic goitre. An interesting account is given of the well-known controversy between Reverdin and Kocher regarding priority in recognition of the state of cachexia strumipriva.

But the author's arrangement of his matter is painfully confused. The first chapter, on the anatomy, histology, and embryology of the thyroid, branches off into a classification of thyroid tumours; after pointing out that these are to be divided into the two great classes—those of branchial and those of mesobranchial origin—the author promptly proceeds to tabulate all forms as of branchial origin. A chapter upon clinical symptoms and diagnosis is followed by one on intrathoracic goitre, and this by a chapter on goitre death; then follow in succession chapters upon circular goitre, congenital goitre, simple goitre and pregnancy, the clinical aspect of malignant goitres (so headed but mainly devoted to myxoedema), the pathology of thyroid insufficiency, congenital athyroidism, and "small thyroid insufficiency"; then comes a long chapter of some 55 pages harking back to the etiology of endemic goitre and cretinism. The disorder of this first half of the book is inexcusable.

The author has gathered all that he "considered of value from the enormous amount of French, Italian, German and English literature on the subject"; but though he mentions names freely he does not give references nor supply a bibliography. It is thus impossible to verify his statements. And to add to the reader's irritation he writes not English, but a jargon in which German and French medical terms are given an English dress, according to his personal choice. There is scarce a page upon which one or more atrocities are not to be found, such as "neoformed vesicles," "parastruma" (for "parathyroid goitre"), "alveoli formations," "anoxhemy," "pavimentous epithelium," "motory" (for "motor"), "medullar" (for "medullary"), "bactericide" (for "bactericidal"), "goiterous." In his preface he thanks J. Philip Schneider, Ph.D., Professor of English, Wittenberg College, Springfield, Ohio, for help in proof reading and seeing the work through the press. We do not expect a Professor of English to be familiar with medical and zoological terms; cannot for instance, hold him responsible for speaking of tunicates as "tuniciers," or teleosts as "temeostiver"; but he might have been expected to see that nouns were not used as adjectives, and not to have passed such expressions as "the liver's epithelium," "unique" (where "single" is meant), "lateral sides of the pharynx" "paroxystic" ("paroxysmal"), "colloid nodules may be singles or multiples," "I operated a malignant adenoma," or "a fibrous cord, called by His the *thyroglossus tractus*, and which extends from the foramen cecum," etc.; "and which" repeatedly offends. We are inclined to suspect that the Professor of English in Wittenberg College must have learnt his English in Germany. What surprises us is that an old and distinguished firm, known for generations for the excellence of its medical publications, should have permitted these errors to pass their proof readers. We can only conclude that in the States, as here, the war has called away invaluable members of the staff and wrought disorganization. The beauty of the illustrations and excellent format of the volume do not atone.

² *Thyroid and Thymus*. By André Crotti, M.D., F.A.C.S., LL.D., formerly Professor of Clinic I Surgery and Associate Professor of Anatomy at Ohio State University College of Medicine, etc. Philadelphia and New York: Lea and Febiger, 1918. (Imp. 8vo, pp. 567; 96 figures, 33 plates in colour, 10 dols. net.)

FRACTURES AND DISLOCATIONS.

The influence of war surgery is not greatly apparent in the eighth edition of Professor LEWIS STIMSON'S *Treatise on Fractures and Dislocations*.³ In an authoritative work of this size, in which 482 pages are devoted to the consideration of fractures, it might have been expected that more space would have been given to this important department of military orthopaedics. Professor Stimson writes about gas gangrene in gunshot fractures, but does not refer to tetanus as a complication. Several illustrations taken from Flint, showing the suspension and extension method of treatment, are reproduced, but we think that more might have been said of the excellent work accomplished by the Harvard unit in France, and by the military orthopaedic hospitals in Great Britain. In France and in this country splints devised on the principles of H. O. Thomas's knee splint, with proximal ring, are now being used by the thousand and giving good results, but we have not succeeded in finding mention of them in this book. Nor does the work on fractures of Hey Groves find notice here.

If Professor Stimson's advice as to the treatment of fractures seems to our mind to err on the side of caution and conservatism, yet it is backed by great experience and sound common sense. He is not enthusiastic in praise of open operation, although he recognizes the value of Lane's and Albee's procedures in certain cases.

His prognosis of the functional results after fracture of the long bones appears unduly optimistic when compared with Dent's records of the Metropolitan Police Force and other British statistics; but those published by the American Surgical Association seem to show that the non-operative treatment is generally more successfully carried out in the United States than in England. This may well be the case, for in our medical schools the attractions of brilliant abdominal surgery eclipse those of the humdrum treatment of fractures to such an extent that in at least one of the general hospitals of London fractures are not admitted to the wards. The consequences of this exclusion must be lamentable, for the student at such a school obtains his licence to practise without having any experience in the treatment of fractures of the lower extremity, although he may be well up in the technique of gastro-jejunostomy and other operations of abdominal surgery. The bad average results of treatment by conservative methods have no doubt had great influence with those surgeons who advocate recourse to plating and similar procedures as a routine method. Their advocacy has, we hope, had the effect of calling attention to defects and stimulating those who differ from them to strive after better results by less heroic methods. In considering and comparing results the author wisely says, "The judicious criterion is often to be found in the ultimate function rather than in form."

In cases of fractures in old persons, such as those of the neck of the femur, Professor Stimson thinks that the risk of pneumonia is exaggerated, and that when it occurs it is not due to recumbency, but that it is "a relatively unimportant incident in a general failing of the strength." Some British surgeons, acting on the same opinion, have had good results, while denying the necessity of getting old persons out of bed before the fracture is consolidated.

It is a good many years now since Sir William Macewen demonstrated by careful experiments and clinical experience that the periosteum does not produce bone. We have not yet encountered any record of experiments which confirm his conclusions. Yet we still find in surgical literature references to the bone-producing functions of this structure. Professor Stimson speaks of it as "a tissue whose activity in the production of bone is marked," and other references to it show that he is uninfluenced by Macewen's work.

The latter half of this book is devoted to the subject of dislocations and presents a full and adequate account of it. There are separate indexes to fractures and to dislocations, and both of them would be more useful if they were much fuller. The illustrations are many and good. There are, of course, printer's errors, and we hope that in subsequent editions Dr. Albee's name will no more be printed "Atlee."

(Yale), Professor of Surgery in Cornell University Medical College, New York, etc. Eighth edition, revised and enlarged. New York and Philadelphia: Lea and Febiger, 1917. (Roy. 8vo, pp. 946; 475 figures, 39 plates, 6.00 dols.)

ORGANIC COMPOUNDS OF ARSENIC.

DR. GILBERT T. MORGAN, Professor of Applied Chemistry in the City and Guilds Technical College, Finsbury, has written a book on the *Organic Compounds of Arsenic and Antimony*,⁴ which will, perhaps, appeal to a limited public but will be of great interest to students of the history of chemistry and to those medical men who care to make themselves acquainted with the constitution and mode of preparation of drugs now commonly in use. As Professor Morgan shows, organic derivatives of arsenic have been under investigation since the earliest times of modern chemistry, and their examination has played an important part in the establishment of current theories of the molecular constitution of matter. It is, however, the therapeutic uses of organic arsenicals which have provoked the more recent activities in the synthesis of these compounds. The fact that corresponding derivatives of antimony have also attracted attention for the same reason has led to their inclusion in this volume.

It was in 1760 that Cadet de Gassicourt stumbled over the threshold of the subject in the course of an attempt to manufacture a sympathetic ink, but it was Bunsen who, in 1837-43, laid the foundations of the knowledge of organic compound containing arsenic. Since then an enormous amount of work has been done, to which Professor Morgan gives references in a chronological bibliography. He takes his reader by gradual stages through the aromatic arsenicals to atoxyl, and then to salvarsan and neo-salvarsan, to the aromatic primary arsines, and to luargol, the salvarsan co-ordination compound with silver bromide and antimony oxide introduced by Danysz. There is a short section on aromatic arsenicals, and the final chapter deals with miscellaneous organic derivatives of arsenic and antimony. The book is completed by an appendix on the estimation of arsenic in organic compounds.

A MEDICAL DICTIONARY FOR LAYMEN.

It is not an easy thing to write a medical book of reference for the ordinary layman, but it is very important that such books should be written and revised from time to time, for a great deal of suffering and many mistakes might be prevented, and much of the prejudice against the medical profession obviated, if general opinion were better informed as to the nature of the problems with which medicine has to deal. In his *Medical Dictionary*⁵ Dr. W. B. DRUMMOND, medical superintendent of the Baldovan Institution, Dundee, has written in the right way. Although it would be easy to criticize the balance of some of the parts—as, for instance, the space given to a somewhat inadequate list of health resorts—we prefer to dwell upon the merits of the book, which are conspicuous. The author has done well to deal with such general subjects as immunity, vaccines, bacteriology, antiseptics, and disinfection, comprehension of which underlies an understanding of so much of modern medicine. Often it is owing to a want of a general knowledge of these subjects that the doctor and the anxious friends of his patient get at cross purposes. To these articles might have been added a fuller account of hormones, the short space devoted to the subject being quite inadequate to afford any intelligible notion to the uninformed reader. A great deal is said about exercises, and this subject, as well as the article on consumption, is copiously illustrated; the illustrations are, in fact, rather a prominent part of the book, and the author has been well advised to reproduce from Saunders's *Hand Atlas of Diseases of Children* very good coloured plates of varicella, rubella, measles, and scarlet fever. The book is one which can be recommended for the purpose with which it has been written—namely, the information of the layman and woman.

NOTES ON BOOKS.

PROFESSOR GLEY is so well known in connexion with the subject that it is most appropriate that his compact and philosophic work on *The Internal Secretions*⁶ should be

⁴ *Organic Compounds of Arsenic and Antimony*. By Gilbert T. Morgan, D.Sc., F.R.S. 1918. London: Longmans, Green and Co. (Demy 8vo, pp. xx + 376. 16s. net.)

⁵ *A Medical Dictionary*. By W. B. Drummond, M.B., C.M., F.R.C.P.E. London and Toronto: J. M. Dent. (Demy 8vo, pp. ix + 625; illustrated.)

⁶ *The Internal Secretions: Their Physiology and Application to Pathology*. By E. Gley, Professor of Physiology in the College of France. Translated and edited by Maurice Fishberg, M.D. London: William Heinemann (Medical Books) Limited. 1918. (Cr. 8vo, pp. 241. 10s. net.)

translated into English. This has been successfully carried out by Professor Maurice Fishberg, of New York, who has incorporated several additions specially written for this edition by the author. The work is divided into three chapters, of which the first deals with the general scope and history of our knowledge of the internal secretions; the second, with the distinctive characteristics of the endocrine glands and the principal products of their activities; and the third, with the functions of the glands of internal secretion, first in normal and then in pathological conditions. The reciprocal relations between the various glands are described in clear language, and later the diseases of the ductless glands are divided into two large categories, those of over-activity and those with lessened activity. This book is written by a physiologist, and therefore naturally appeals more to physiologists than to practising physicians.

A PAMPHLET by Viscount Grey of Fallodon on *The League of Nations* has been published by the Oxford University Press (price 3d. net). The main contention of the essay is that it does not follow that a league of nations to secure the peace of the world will remain impossible because it has not been possible hitherto, and the author proceeds to lay down certain conditions which must be fulfilled. The first is that the idea must be adopted with earnestness and conviction by the executive heads of state, and the second, that the governments and peoples of the states willing to found it must understand clearly that it will impose some limitation upon the national action of each, and may entail some inconvenient obligation. He recognizes that the pressure of the league must be more than economic, and that those states that have power must be ready to use the force—economic, military, or naval—that they possess. Some previous attempts in the direction have failed because it was not clearly understood and accepted that violation of the agreement by one or more states did not absolve all or any of the others from the obligation to enforce the agreement.

Dr. REGINALD COCK has published a second edition of his pamphlet, *Counsel of European Nations*.⁷ His thesis is that the only proper basis for international relations rests on the recognition of true principles of Christianity. He prints a translation of the Pope's note of August, 1917.

The introduction to Mr. PAUL NASH's number (III) of *British Artists at the Front*⁸ contains a most unhappy simile. Mr. Salis says that Mr. Nash's "comprehension of nature is a thing as born in him as his skeleton." But we can agree that the artist has grasped and depicted what Nature has suffered, and by his landscapes of ruined woods and fields suggests the like devastation that has swept over man. The drawings are powerful and true, if grim; but they deal with grim subjects, and the artist knows for he has served among the ruins. The new number (II) of *Admirals of the British Navy*⁹ begins with Admiral Beatty and ends with Vice-Admiral Keyes, who organized the raids on Zeebrugge and Ostend.

MEDICINAL AND DIETETIC PREPARATIONS.

Kerocain.

KEROCAIN is the proprietary name adopted by Messrs. Thomas Kerfoot and Co. (317, Upper Street, Islington) for the British-made novocain now being manufactured by them under licence from the Board of Trade. Messrs. Kerfoot have supplied us with samples for examination, and we find that kerocain is pure para-amino-benzoyl-diethyl-amino-ethanol hydrochloride, identical in chemical composition with the German-made article, and therefore perfectly suitable for replacing it as a local anaesthetic. Kerocain is supplied in powder, solution, and tablet form, the tablets being of various convenient weights, and containing kerocain either alone or in combination with adrenalin.

Dormigene.

DORMIGENE, which is monobrom-isovaleryl-urea, and is therefore identical in chemical composition with bromural, is now being manufactured under special Government licence by Messrs. Allen and Hanburys, Ltd., and this firm has recently supplied us with samples of dormigene tablets (5 grain) and dormigene powder. Examination of the samples shows dormigene to be pure monobrom-isovaleryl-urea possessing all the chemical and physical

characters of the German article bromural. The therapeutic action of dormigene is therefore doubtless also identical with that of bromural, which has considerable reputation as a sedative and hypnotic.

THE SCOTTISH HIGHLANDS AND ISLANDS MEDICAL SERVICE BOARD.

THE fourth report, for 1917, of the Highlands and Islands Medical Service Board¹ states that before the war there was difficulty in securing adequate medical and nursing services for the Highlands and Islands of Scotland. In very few districts had there been anything more than the bare minimum of medical men necessary for the work under normal conditions, and in some areas the medical service had been, for geographical and other reasons, admittedly inadequate; in many districts also the need for skilled nursing was pressing. The medical and nursing services have both been gravely affected by the war. In most instances medical men on active service have been able, with the assistance of the Scottish Medical Service Emergency Committee and the Board, to arrange with colleagues for their work, but the men doing double duty have found the task heavy, and in some instances considerations of health have compelled them to give up the attempt to overtake the additional work. The Board and the Emergency Committee have endeavoured to make temporary arrangements with medical men ineligible for or discharged from military service, with older men who have given up general practice, or with natives of British dependencies who have recently qualified at Scottish universities, but it is now almost impossible to find suitable men for temporary appointments. If a supply of trained nurses were available for the assistance of practitioners at present overworked, the situation would be relieved, but the call for nurses for war work has been not less insistent than for medical men, so that there is now almost as much difficulty in securing the services of qualified nurses as in finding medical men.

The Medical Service.

In 1917, as in 1916, the Board has found it impossible to proceed with the organization of all the branches of work covered by its schemes, but the introduction of a medical service at modified fees to persons of limited means, irrespective of their distance from a doctor, was one as to which steps could at once be taken, and such service was established as soon as the scheme was approved by the Secretary for Scotland. The scheme provides for medical attendance at fees which must not exceed 5s. for the first visit, and 2s. 6d. for each subsequent visit in the same illness, on the families and dependants of insured persons, on uninsured persons of the crofter and cottar classes and their families and dependants, and on others in like circumstances to whom the payment of the practitioner's ordinary fee for attendance would be an undue burden; the maximum fees in midwifery cases to be paid by persons of these classes, including fees for any subsequent visits, was fixed at £1. The essential part of the Board's scheme was that the fees should be the same, whatever the distance of the patient from the doctor's residence, the difference being made up by the Board out of its Treasury grant.

At the start of the scheme, as the Board had no data on which to base a method of remuneration, it arranged as a provisional measure to pay in most cases subsidies representing approximately sums equivalent to the loss that would be incurred by practitioners in working the scheme, and this method may still be employed in suitable cases, but the Board does not consider that in the varying conditions of medical practice it is entirely satisfactory as a permanent means of equitably administering the fund for medical service. As the subsidies now payable to practitioners are, in effect, travelling grants to enable them to attend distant patients at a low uniform rate, the Board considers that a more satisfactory method of payment for the majority of the practices in the Highlands and Islands would be to fix the grant in relation to the actual travelling in work done for the Board. It is recognized that the advance in the cost of travelling has imposed a severe

strain upon practitioners in the Highlands and Islands and many representations have been received from all parts of the Board's areas in regard to the inadequacy of the grants, and of the inability of the medical men to carry on under present conditions. The Board admits that these representations deserve very serious consideration in view not only of the increased cost of travelling, but also of the great difficulty in securing suitable men for service in the Highlands, and the heavy responsibilities resting on the men who are doing the work. The Board, in drawing up a special scheme, seems to have been moved partly by a sense of justice, and partly by necessity. The scheme, which has been approved by the Secretary for Scotland, makes provision for the assessment of subsidies on a normal pre-war rate per mile of travelling involved in attending boards and insured persons and for payment of temporary supplementary grants based upon the difference between the normal rate and an increased rate regarded as equitable in present circumstances. The specified rates are payable on miles travelled from the doctor's door, both outward and homeward journeys being reckoned. The grants are to be based under the agreement with practitioners on a normal rate of 6d. a mile, and supplementary grants are to be made for the past year. These will be made (1) up to an amount representing a rate of 9d. a mile on travelling by motor car, motor cycle, horse and trap and boat, and 7d. a mile on travelling by train, ordinary cycle, and on foot. No payment will be made to any practitioner whose grant under his agreement represents higher rates than those specified, except in certain cases—namely (2), in consideration of special circumstances affecting particular practices, and (3) in consideration of the inadequacy of the total remuneration derived from a practice the grant may be supplemented. The scheme for a medical service of modified fees has been in operation in all save a few parishes since the beginning of 1916. The Board has arrangements in force in 141 practices. The estimate of the cost of the scheme for 1917 was £22,000, and the actual expenditure was £21,300. It is estimated that for the special and temporary grants a further expenditure to the extent of approximately £5,000 will have to be met for 1917.

The Nursing Service.

Though the difficulty of securing the services of trained nurses grew during 1917, and no development of the services contemplated can be looked for in existing conditions, no association in the Highlands and Islands in receipt of a grant from the Board was obliged to suspend its activities entirely in 1917, but when a nurse has resigned the associations have as a rule been forced to make temporary arrangements with nurses who have not undergone so long and varied a training as their predecessors. It was recognized in 1916 that there was urgent need for unification of the nursing service if overlapping was to be avoided and economy in administration secured, but so far no progress has been made with the formation of associations on a county or district basis except in the district of Lewis, where some twelve nurses previously in the employment of as many separate local associations are now under the management of the district committee, which acts as the central nursing authority for the island. The district committees, public health authorities, parish councils, and school boards all contribute to the maintenance of the nurses, whose services are available for the treatment of patients for whom these authorities are responsible. Substantial assistance has been received from the Ladies' Highlands Association, the Duchess of Montrose's Scottish Nursing Trust, and the West Coast Mission; residents in the various districts have also made voluntary subscriptions.

AT the recent congress of the Women's Co-operative Guild at Birmingham a resolution was adopted urging the establishment, under the control of the public health authorities, of a national service of midwives free to all and financed by a 75 per cent. Exchequer grant.

BILLS have been introduced into the New York State Legislature providing for the expenditure of £500,000 to be applied to the construction of buildings to accommodate the insane and feeble-minded. Bills have also been introduced providing for the enlargement of state institutions for lunatics, and the establishment of a psychopathic hospital in New York City.

SATURDAY, JUNE 29TH, 1918.

THE BURDEN OF COSTLY REMEDIES.

WE have received a copy of the decision in an appeal to the English Insurance Commissioners by Dr. F. C. Fisher against the refusal of the Hertfordshire Insurance Committee to repay him the sum of £4 odd, which he had expended in the purchase of tetanus antitoxin for the treatment of an insured patient. The facts of the case were not in dispute. Dr. Fisher found the patient to be suffering from tetanus, and considered it necessary for his proper treatment to administer antitoxin, a supply of which he obtained at once from a firm of wholesale chemists. He had entered into a contract with the Insurance Committee to supply drugs required for those of his insured patients who lived more than a mile from a chemist, the payment being upon a capitation basis; the patient in question was one of such insured persons.

The question at issue was whether the antitoxin administered in this case fell within the category of the drugs and medicines which Dr. Fisher was under obligation by his agreement to provide in consideration of the capitation payment, and therefore without any further payment. The London and Counties Medical Protection Society contended on behalf of Dr. Fisher that the antitoxin was not a drug or medicine within the meaning of the medical benefit regulations, and of his agreement with the Insurance Committee. On this issue the Commissioners offered to give a decision without a hearing, but the solicitors for the appellant urged that opportunity should be given for the case to be argued at a hearing, on account of the importance to insurance practitioners of the issue involved, and the case was accordingly heard.

The Commissioners' decision and the arguments upon which it rests cover nearly ten typewritten foolscap pages. The relevant provisions of the Act and Regulations are recited and compared in order to dispose of the contentions put forward on behalf of Dr. Fisher. Medical benefit is defined in the statute to include the provision of proper and sufficient medicine and such medical and surgical appliances as may be prescribed by the regulations, and it is the duty of Insurance Committees to make provision for the supply of drugs, medicines, and appliances to insured persons in accordance with the regulations. The regulations lay down the circumstances in which arrangements for the supply of drugs (including medicines) may be made with medical practitioners instead of with chemists. Practitioners may be paid for drugs supplied by them for their patients in one of two ways: they may be paid in respect of drugs actually supplied, or, in exceptional cases, in rural areas they may be paid by capitation fees without reference to the nature or cost of the drugs actually supplied. The net effect of the various provisions taken together is held to be that insured persons are entitled, as part of their medical benefit, to a supply of all drugs requisite to their treatment under the Act. Whether a doctor supplying all drugs shall be paid on

the one basis or the other is a matter of agreement between him and the Committee.

On behalf of Dr. Fisher it was argued that, while he had agreed with the Committee on a capitation basis for the supply of drugs to the insured persons on his list, yet the antitoxin which was necessary for this particular case was outside the scope of the agreement, either (1) because it was not a drug or medicine, or (2) because, while it might be the duty of the Insurance Committee to arrange for its supply, the agreement between Dr. Fisher and the Committee did not impose a corresponding obligation upon him. The contention that serums and vaccines are not properly included among drugs and medicines is dismissed as contrary both to the intention of the Act and to the opinion of the medical profession generally. The second contention, that Dr. Fisher's agreement did not cover the obligation to provide this substance in consideration of his capitation fees, is likewise dismissed pontifically, as based on a misreading of the regulations. It is ruled that a contract of the kind entered into by Dr. Fisher covers the provision of all kinds of drugs and medicines to which an insured person is entitled as part of his medical benefit, including those which would otherwise than in a rural area be supplied by a chemist. In short, having contracted to be paid on a capitation basis and not for drugs supplied, Dr. Fisher was not entitled to recover the £4 spent by him on antitoxin. The full text of the concluding paragraphs of the decision is as follows:

On the case as a whole, therefore, I find: (1) That anti-tetanus antitoxin is a drug or medicine to the supply of which the insured person concerned in the present case was entitled in the circumstances of the case, as part of his medical benefit; (2) that if it had not been such a drug or medicine the present appeal must fail, because in those circumstances the Insurance Committee would be under no liability to provide it, and the doctor would have no claim upon them for repayment, and the provision of the substance then would have been entirely outside the scope of the Act; (3) that Dr. Fisher had entered into a contract under which it was his duty to supply to his insured patients all drugs and medicines required as part of their medical benefit; (4) that under the particular agreement into which Dr. Fisher had entered he contracted to be paid for all drugs and medicines supplied to his insured patients by an inclusive capitation payment, and was not entitled, therefore, to be paid separately in respect of the medicines supplied in the present case.

I therefore dismiss the appeal. In doing so I am compelled to comment upon the waste of the time, energy, and money of all concerned, especially the Insurance Committee, that has been occasioned by the insistence upon a hearing in a claim for recovery of money under an agreement, where the facts were not in dispute, and the arguments put forward in support of the claim showed so little attention to the provisions of the agreement as was evinced in the present case.

Dated this seventh day of June, 1918.

J. SMITH WHITAKER.

From the technical point of view this decision may be correct. But since it is partly based on the alleged general opinion of the medical profession we would point out that the Insurance Acts Committee of the British Medical Association, on January 13th, 1916, recorded its opinion that the provision of proper and sufficient medicines as contemplated by the Insurance Act does not include the supply of salvarsan, vaccines, serums, etc. It was further resolved on the same day that, with a view to the proper treatment of insured persons suffering from diphtheria, public health authorities should be urged to use the powers

which they possess, and which most of them utilize, to supply antidiphtherial serum gratuitously.

Since these resolutions were adopted, over two years ago, the State has recognized the principle that certain special remedies which are costly and difficult to procure are not to be reckoned among the ordinary drugs which chemists, and those doctors who supply medicines directly to their patients, should be expected to provide in the ordinary course. A case in point is salvarsan and its congeners. Last year the Council of the British Medical Association, in defining the policy which should be adopted by the Association in the matter of the diagnosis and treatment of venereal diseases, declared that salvarsan and other expensive drugs should be supplied free of cost to all medical practitioners for the treatment of their patients, and this principle was approved by the Annual Representative Meeting.

In order that all persons should be placed in a position to receive what is believed to be the most effectual treatment, the State has, in fact, decided that the special remedies for venereal disease shall be supplied by local authorities, and has undertaken to reimburse them for the greater part of the cost. Again, local authorities—at any rate, all the more enlightened of them—supply not only antidiphtherial serum, but also serums for the prevention and treatment of typhoid fever. We have no doubt that this principle will and ought to be extended, and we have equally no doubt that, though tetanus may not be reckoned as an infectious disease in the ordinary sense in which that term is employed, public authorities ought also to undertake the supply of antitetanic serum. Last year the Lister Institute of Preventive Medicine produced at its laboratories at Elstree 86,647 doses of tetanus antitoxin for the army, the navy, and the overseas forces. The value of antitoxin in the treatment of tetanus was insisted upon by the War Office Committee on Tetanus in 1916, and it expressed its opinion still more emphatically last year, when it said that “in acute general tetanus the best method of treatment lies in the earliest possible administration of large doses of antitoxic serum by the intrathecal route, repeated on two, three, or four days in succession, and combined, if thought desirable, with intramuscular injections.” The diversion of the energies of the Lister Institute to the production of tetanus antitoxin for the military forces may well have made it difficult to procure it in the market, and may therefore justify the price stated to have been charged by the wholesale chemists in this case; in view of the strong expression of opinion by the War Office Committee we should have imagined that the Insurance Commissioners, and especially a medical commissioner, would have recognized the obligation to put this means of treatment at the disposal of insured persons. The decision we have quoted seeks to place upon the insurance doctor the obligation to supply this costly remedy under a contract which undoubtedly never contemplated any such large expenditure upon a single item of treatment. It is on this ground that we look upon the decision as inequitable—and not only inequitable, but impolitic, and contrary to the public interest.

Furthermore, we in our turn are “compelled to comment” upon the general tone of this document, and in particular that of its last paragraph. For some time past we have observed with regret a tendency on the part of the Insurance Commissioners, in virtue of certain quasi-judicial functions with which the law has endowed them, to play the schoolmaster to the medical profession. In this instance a responsible professional body raised on behalf of its

member a point upon which no definite ruling had hitherto been given. It is one of the specific duties of the Commissioners to hear such appeals, and a magisterial air of reproof was out of place.

INDUSTRIAL HEALTH AND EFFICIENCY.

THE Health of Munition Workers Committee has issued its final report.¹ We make the announcement with some regret, for the Committee, since it was appointed in September, 1915, has done a great amount of extremely valuable work. The problems which it had to investigate were not indeed new, for they have been studied more or less by all industrial nations. In this country during the last twenty years great progress has been made under the Factory Department of the Home Office in many of the essentials of health in the workshop, and for several years before the war employers were showing that they had begun to recognize the importance of humanizing the life of the industrial worker and providing better conditions. But the Committee not only rendered existing information available in the long series of its reports, but instituted investigations which have yielded most important results. In spite of all that had been done in the critical examination of certain dangerous trades much remained to be learnt as to the effects of occupation on the rates of sickness and mortality, even in males, while as to women and young persons reliable data were almost wholly lacking. So also was information as to the relation of fatigue to disease, and as to the proper length and distribution of hours of labour, and the relation of these data to output. We have from time to time, as the various memorandums were published, endeavoured to indicate what the Committee had accomplished, but, considerable as has been its achievement, much remains to be done. In this final report the opinion is expressed that it is necessary to make arrangements without delay for a national scheme of industrial medical research and to accord full recognition to the importance of industrial hygiene.

The work of the Committee has been concerned with an emergency, but the munition worker is a type of all workers, and as we have frequently endeavoured to show, the principles at which the Committee has arrived concern, in fact, all forms of industrial labour. Such problems cannot be solved by medical investigation alone, for they are intimately related to larger social and industrial problems, but they cannot even be accurately stated without it. The question of shorter hours of labour is regarded as lying near the root of the whole labour problem; further, the conditions of women's labour raise social and economic issues of vital importance to the future of the race. Again, the solidarity of industrial society—the interdependence of employers and workers—is closely related to the whole issue of the status, health, and physical equipment of the worker. Finally, there is the title of the worker to an effective voice in determining the conditions under which he works. “If industry,” the report says, “be indeed a national service, the object of those engaged in it is the good of the community as a whole, and the worker should have a fair and legitimate share in the responsibility of the transaction.”

If we regret the disappearance of the Health of

¹ *Industrial Health and Efficiency*. Final report of the Health of Munition Workers Committee. Ministry of Munitions. His Majesty's Stationery Office. (Cd. 9365.) To be obtained through any bookseller. Price 2s. net.

Munition Workers Committee, it is largely because it has shown itself possessed of the influence and force to get the necessary inquiries carried out and has displayed fine scientific judgement in the choice of subjects for inquiry and the selection of investigators. The work needs to be continued, and we can only hope that the Advisory Committee recently appointed by the Minister of Munitions may be able to convince the Ministry that without further investigation the advice it will be able to tender will be of diminished value. It is true that one result of the work of the late committee was the establishment in January, 1916, of a welfare section of the Ministry of Munitions, which early last year was reorganized under the direction of Dr. E. L. Collis, a medical inspector of factories, and a member of the Health of Munition Workers Committee. The new department is responsible for all matters concerned with the health and welfare of munition workers in national as well as in controlled factories, including the medical problems involved in the prevention of T.N.T. poisoning, and the maintenance of the health of those employed in the manufacture of lethal gasses. Its sphere also covers the conditions of life of munition workers outside the factory, and the inspection of the large number of temporary hostels. Recently it has been taking steps to deal with the various maternity problems which arise in munition areas. Provision has also been made to enable the section to undertake research, and the collection of the accurate knowledge on which administrative action should be based. Another step of importance was taken when, under a recent Act, the Home Office was empowered to make orders requiring special provision to be made at a factory or workshop for securing the welfare of workers, including such matters as the preparation and taking of meals, the supply of drinking water, protective clothing, ambulance and first aid arrangements, and the supervision of workers.

The report now issued by the Health of Munition Workers Committee is comprehensive, and its perusal will on all the main heads supply inquirers with the information contained in the various memorandums issued from time to time, and in the report on industrial efficiency and fatigue published in February, 1917. The Committee recognizes that during the industrial revolution which came about in England during the nineteenth century there was a tendency for the fantastic conception of Samuel Butler, the author of "Erewhon," to be realized, and for the man to be made subservient to the machine. The Committee is convinced that to secure harmony and smooth working, efficiency, and maximum output, the machine must be made subservient to the man, for it is his life, mental development, and moral well-being which guarantee effective labour. Physical health is the basis, and its physiological justification must be a correct understanding of the part played by nutrition, by rest, by fatigue, and by general conditions affecting health, if waste is to be avoided and maximum energy attained. This is true, because physical health is necessary to mental well-being, and is at the basis of social and moral development. The matters dealt with in the report concern the future as well as the present, and are among the root problems for latter-day preventive medicine, which has as its object the removal of the occasion of disease and physical inefficiency, combined with the husbanding of the physical resources of the worker in such a way and to such a degree that he can exert his full powers unhampered, with benefit to himself and his countrymen.

OUR THREE THOUSANDTH NUMBER.

THE present issue, which completes the first volume for the year, is the 3,000th number of the *BRITISH MEDICAL JOURNAL*. This numbering does not include the issues of our forerunner, the *Provincial Medical and Surgical Journal*, which was taken over by the Association at an early date in its history. The *Provincial Medical and Surgical Association* was founded on July 18th, 1832, by Sir Charles Hastings, at a meeting of fifty medical men in the board room of Worcester Infirmary, and for some years afterwards a volume of *Transactions* was issued annually. The first number of the *Provincial Medical and Surgical Journal* appeared on October 3rd, 1840. Though privately edited, it was circulated weekly among the members, and in 1844 it was taken over by the Association, and became its official organ. Eight years later, at the annual meeting in Oxford, it was decided that the *JOURNAL*, which was then being published fortnightly at Worcester, should again be issued weekly, and should be edited and published in London; the first number under the new arrangement appeared with the title of the *Association Medical Journal*, at the beginning of January, 1853. In 1856 it was unanimously resolved that the name of the Association should be changed to the British Medical Association, and in conformity with this decision the first issue for 1857 bore the title *BRITISH MEDICAL JOURNAL*, No. 1. In July, 1867, the *JOURNAL* was enlarged, and during the next half-century its scope was greatly widened and the number of pages in each weekly issue increased to meet the growing needs of the Association, the steady increase in its membership and influence, and the progress of medical science. Thus the *JOURNAL* took its place among the foremost medical periodicals of the world. The *Epitome of Current Literature* was added in 1892, and in 1903 the publication of the Supplement was begun. In January, 1906, the size of our page was increased and its shape changed to that with which members are now familiar. Since the beginning of the war the number of pages has steadily diminished through the operation of causes over which the Association has no control, and the tinted cover introduced in 1906 has this year been dropped for the same reason. The war has seriously affected the production of the *JOURNAL* owing to the untoward economic and commercial conditions it has brought about. In particular, the regulations and orders of the Paper Controller, made under the Defence of the Realm Act, have steadily curtailed the amount of paper available, so that there has been no alternative but to make a corresponding reduction in the number of pages in the weekly issues of the *JOURNAL* and Supplement. The new order of the Paper Controller, which came into force on March 1st, was of a most drastic kind. It reduced the amount of paper and paper-making materials which might be imported to half the tonnage imported in the previous year. This reduction took effect on a supply already reduced by one-third; consequently the Council was compelled to reduce still further the number of pages in the weekly issues of the *JOURNAL*. At the present time the total number available for text, Supplement, and advertisements is only 64, whereas the number of pages available before the war for the text, *Epitome*, and Supplement alone ranged from 80 to over 100, while the number of advertisement pages equalled or exceeded those figures. Only those who are actually engaged in the work can be expected fully to realize the difficulties that have to be faced nowadays week after week by the editorial and business staffs. Without undue self-praise we may fairly claim that, within the limits imposed by war restrictions, the *JOURNAL* of to-day continues to represent British scientific medicine as it should be represented, whilst helping to fulfil the primary duty of the great organization of which it is the mouthpiece—namely, the maintenance of the honour and interests of the medical profession.

THE EDUCATION OF BLINDED SOLDIERS.

We have received a copy of the third annual report of St. Dunstan's Hostel for Blinded Soldiers and Sailors, and are indebted to Sir Arthur Pearson for some observations elicited by a paragraph published in our columns of May 4th, p. 513, giving an account of what was being done in Germany for the same class of men. The fact that the report before us is the third, and is for the year ending March 31st, 1918, is sufficient to show that the work was taken in hand in this country early, and what has been accomplished proves that it was organized on the right lines. To Sir Arthur Pearson belongs the credit not only of having started and supervised the whole organization, but also of having infused into the institution a spirit of hope and courage which cannot fail to impress, and not a little to astonish, every visitor. The governing idea is to teach the blinded man to work and, if possible, to return him to his original industry or occupation. But at the threshold an important principle has to be recognized, which is that to work under the handicap of newly inflicted blindness imposes a very much greater mental strain than those who can see would imagine. It is owing to the recognition of this principle that the working day has been made short, and the satisfactory result is that the men acquire their knowledge and learn handicrafts with remarkable speed. The hours of work are from 9.30 to 12 in the morning, and from 2.30 to 4.30 in the afternoon, with an optional extra hour in the afternoon. The men who work in the class-room in the morning are in the workshop in the afternoon, and vice versa. In the class-rooms they are first taught to read Braille, the facility with which they acquire it depending not only upon their intelligence, but also upon the sensitiveness of their touch; they also learn to write in Braille with the aid of an ingenious machine. Typewriting is also taught in the class-rooms, and it is found that almost all men can rapidly learn to turn out very accurate work. The typewriters used are Remington machines, with the addition of a Braille scale, and a special machine for men with only one hand has been built by the Remington Company after consultation with the experts of St. Dunstan's. Typewriting, however, is, as a rule, taught as a means not of occupation but of communication. When he has passed the writing test, every man is given his own typewriter, and the National Library for the Blind has made arrangements for lending for a man's life any quantity of Braille literature. Cobbling, an occupation for the blind very little practised until it was developed at St. Dunstan's, is now followed by a large number of men. A blind man in the course of six or seven months can learn to sole and heel a pair of boots as well as it can be done, and the men who have left the hostel are making good earnings. They are also taught mat-making to fill in time when cobbling is slack; it is the easiest of the occupations for the blind, and some men learn it only. Basket-making, the oldest of the staple industries for the blind, is taught also, the men being trained to make a good variety of saleable baskets. Another industry taught in the workshops is joinery, but unless a man has followed that trade before his disablement he is taught to make only easily saleable articles, such as picture frames, trays, corner cupboards and ornamental tables; these they turn out as well and quickly as can a sighted workman. Poultry farming, which seems an unlikely industry for blinded men, has proved very successful; the men can distinguish birds of different breeds almost instantaneously by touch, manage incubators and foster-mothers, prepare and truss birds for table, and generally conduct a poultry farm on commercial methods. Provision is also made for men who do not wish to follow an ordinary manual occupation, and the most surprising result is that they can become shorthand writers, using a small ingenious machine which enables Braille in its most condensed form to be taken down at a speed equal to that of the ordinary shorthand writer. The notes are written

out on the typewriter. A man with a good knowledge of Braille writing and typewriting can be trained to be a telephone operator and can obtain employment in business exchanges, where the drop-shutter system is in use. Lastly may be mentioned massage, which is very thoroughly taught, and is said to be the one occupation which a well trained blind man is able to follow not merely as well as, but even better than, a man with sight. The students are given preliminary teaching in anatomy, physiology, and pathology at St. Dunstan's, and then pass to the massage school of the National Institute for the Blind. Finally, men in the more advanced classes are allowed to massage patients in some of the leading London hospitals. The men are all required to pass the examination of the Incorporated Society of Trained Masseurs, and so far none has failed. At the last examination one of them passed second of the 320 entrants. In the paragraph to which we have referred it was stated that the blind masseur in Germany was a failure, owing, it was suggested, to the fact that the Germans distrust him. Sir Arthur Pearson expresses surprise at this statement, and adds that about forty men from St. Dunstan's are now practising massage with the highest degree of satisfaction to themselves and to the patients. He also informs us that he entirely disagrees with the principle of sending blinded soldiers to existing institutions for the blind. The plan was tried in Canada and Australia, but found unsatisfactory, and some of the men who had returned are now being sent back to St. Dunstan's. Finally we may agree with him that the German estimate of 2,000 in the spring of 1917 as the number of men coming within the definition of blindness ($V = \frac{1}{25}$) accepted by the German War Office must be an understatement. The English figure at that date was about 800 and the French 2,500. The doctrine of averages, which applies to the nature of casualties as to everything else in human life, would make it probable that the number of Germans blinded in the war must be greater than the number of French. However this may be, we may conclude this notice by expressing the opinion that the work done at St. Dunstan's Hostel is of a nature in which this country may take just pride.

THE SCIENCE OF RATIONING.

CAPTAIN M. GREENWOOD has added to his reputation as a medical statistician by the issue of three valuable papers. The first, published by the Medical Research Committee, gives the results of the investigation of the composition of dietaries with special reference to the dietaries of munition workers.¹ The second, on the efficiency of muscular work, was published in the *Proceedings* of the Royal Society. The third, an epidemiological study of the food problem, was communicated to the Royal Society of Medicine. In the first, a joint publication with Viscount Dunluce, the authors give a useful summary of modern dietetic investigations not to be found elsewhere in so concise and convenient a form. This critical summary will be of great value to those who want to know the scientific foundations of rationing and the worth of the evidence on which it is based—the work of Voit, Rubner, Atwater, and others. "When," say the authors, "the body lives on itself it is rigidly economical. So soon as its ready money (the normal reserve of carbohydrate in the liver and muscles) has been spent and the first-class securities in its bank (the body fat) have also been realized and spent, it reduces its establishment. The less vitally essential cells are allowed to fall in pieces and the ruins used to stoke the furnace, for which no fuel can be purchased. But if the body is given building material (protein), it passes directly from pessimistic economy to optimistic schemes of reconstruction. The demolished cells are rebuilt without regard to the fact that this will again increase the demands for more fuel of the body

¹ BRITISH MEDICAL JOURNAL, April 27th, 1918, p. 434.

as a whole. Hence it may happen that a supply of protein will paradoxically not satisfy but increase the cravings for food, because it will lead to the re-formation of cellular units, which will then demand supplies of energy, rather than be itself used only as fuel for the reduced establishment." Reduction of mass of living cells and a low protein diet is the way the Germans withstand their war shortage; their children, stunted by low feeding, may be expected to grow to full size when the full time comes. The authors give details of the working class dietaries in war time, and the war time dietaries of Germans. The installation of canteens and the "eat less bread" campaign together led to the eating of much more fat and protein, the more expensive constituents, by the munitioners than was customary before the war. The collected data show that 3,500 calories in food, as purchased, is the requirement of workers engaged on moderately strenuous tasks. The consumption, as far as calories are concerned, does not appear to have changed during the war. The compulsory rationing has rightly brought down the fat and meat consumption and put up that of foods rich in carbohydrate. Of the epidemiological study in which Captain Greenwood was associated with Miss Cecily Thompson we gave an account on February 23rd (p. 239) and March 16th (p. 317), and noted that the reduction of the diet in Millbank Penitentiary in 1823 led to scurvy and the death of many prisoners. In his paper on the efficiency of muscular work Captain Greenwood, after mathematical analysis of available data, concludes that "within fairly wide ranges simple formulae of linear regression describe the relations subsisting between heat production, body mass, and work performance with an accuracy sufficient for such purposes as roughly computing the energetic needs of workers doing the kind of work studied." "No law connecting heat production and work performance can be properly formulated until the range of experimental observations under uniform conditions has been carried below the starting point of existing records."

HAEMORRHAGIC SPIROCHAETAL BRONCHITIS.

VIOLLE has reported¹ that during the first three months of this year he saw in a naval hospital near Toulon thirty cases of bronchitis due to infection by a spirochaete. The disease was first observed by Castellani in Ceylon in 1906. Waters described numerous cases in India (1909), and cases have also been observed by Branch in the West Indies and by Jackson in the Philippine Islands. Castellani described it as occurring in two forms—acute and chronic; the latter was sometimes the sequel of the former, but apparently in the majority of cases the onset is insidious. He describes the expectoration in the acute cases as scanty and mucous in character, and in the chronic cases as muco-purulent, but not abundant. The most striking characteristic, however, is that frequently for several days together the expectoration contains blood intimately mixed with the muco-pus. In some cases there is genuine haemoptysis, one or two teaspoonfuls of blood, or even more, being expectorated, and hectic fever may be present. Physical examination reveals very little beyond a few dry or coarse râles. The possibility of error in diagnosis is obvious, and it is not surprising to hear that some of the cases were admitted into the naval hospital with a diagnosis of suspected tuberculosis. Violle states that in his cases the expectoration contained innumerable spirochaetes varying in form and dimensions, some long and fine, others short and thick; sometimes with well-marked close spirals, sometimes with only delicate undulations; Castellani considers it probable that several varieties of spirochaetes are concerned. Very often no other organisms were seen, although in other instances various microbes were noted. Further, Violle agrees with Castellani in stating that the bronchial affection may become complicated by pneumonia, bronchopneumonia,

or tuberculosis, the lesions produced by the spirochaete opening up the way for the more lethal bacilli. The prognosis appears to be good, but the disease may last for a long time, even years, and Violle states that relapses frequently occurred in his cases. The disease is, he believes, very contagious. He assumes that it was imported into France by Chinese or Indo-Chinese labour companies, or by troops that had been for some time in the Levant. He considers it probable that the parasite may become acclimatized in France, at any rate in the south, and notes that a quarter of his patients were French. The life cycle of the parasite is not known, but in one stage it appears to produce coccoid bodies, and Violle believes that it is by them that the contagion is disseminated.

EGYPTIAN OPHTHALMIC HOSPITALS.

THE Fifth Annual Report on the Ophthalmic Hospitals of Egypt (1917), by the Director, Mr. A. F. MacCallan, F.R.C.S., shows a steady increase in the amount of work undertaken by the ophthalmic service. The number of new patients in the year under review (1917) increased by 19 per cent. The number of out-patient attendances in the year reached 1,004,161. The number of the blind persons seen remains the most striking feature of the report. No fewer than 13,996, or 13.9 per cent. of all the patients examined, were blind in one or both eyes; 4,611 were blind in both. The report notes that in Egypt blindness in one eye is not nearly such a serious disability as in European countries. It is true that it is impossible for a person so affected to enter the Government service as a clerk with rights of pension, or to get some of the technical jobs as handicraftsman; but it is remarkable how well some men who are blind in one eye only manage to do work that requires a good judgement of distance. Blindness in both eyes entails little of the misery which it entails in European countries. In Egypt, not only are blind people well cared for by their kin, but, thanks to the sun, do not suffer from cold. Owing to the large number of blind in Egypt, it would be highly uneconomical to undertake charitable provision for them on any large scale when the prevention of blindness is so meagrely endowed. The most effective measure that can be taken for the prevention of blindness will be the provision of hospitals where early cases of acute conjunctivitis can be dealt with. The report contains further matter on the correlation of temperature and conjunctival infections, which supports the previous conclusions that the summer rise in temperature is the precursor of epidemics of severe conjunctivitis.

STATE MILK CONTROL.

THE Committee on the Production and Distribution of Milk, of which Major Waldorf Astor, M.P., is chairman, has expressed the hope that the Government will give effect to recommendations made last February, that state control of the wholesale distribution of milk should be instituted as a temporary measure. This opinion was expressed in a letter covering the report of a subcommittee, over which Mr. Wilfred Buckley presided, with reference to the control of the collection, utilization, and distribution of milk sold wholesale. The main recommendations of the subcommittee, which have been endorsed by the committee, are designed to ensure the maintenance of the milk supply, the economical handling of milk, its equitable distribution, and the full utilization of surplus supplies for manufacturing purposes. It proposes that Great Britain should be divided into suitable areas, each under a milk superintendent acting under the instructions of a central authority in London, with a separate Advisory Committee for Scotland. It is proposed that a national clearing house should be set up in London to control the wholesale trade of the country, employing persons, firms, or societies, with authorized wholesale agents as far as may be necessary. The clearing house would take over existing contracts between wholesalers and producers, but would interfere as little as

¹ *Bull. de l'Acad. de Méd.*, T. lxxix, p. 429.

possible with direct contracts between producers and retailers; such contracts should, however, be subject to the supervision and approval of the milk superintendent for the area. All churns in the possession of wholesale dealers other than retail delivery churns should be acquired by the clearing house, which would encourage producers to form co-operative associations for the purpose of improving the conditions of milk production and the manufacture of cheese. Finally it is recognized that milk should be produced and supplied under improved conditions, so that it may be cleaner and more wholesome when it reaches the consumer. The subcommittee recommended that in appointing traders to be agents of the Ministry of Food the Government should at once obtain an option to purchase the business of such traders at a fair value, since experience may ultimately show that it will be necessary for the state to become the sole wholesaler of milk, a development the subcommittee considers desirable. This last recommendation was not accepted by the full committee, which believes that before coming to any decision on the point more evidence is required both with regard to the financial terms and to the practical effects of purchasing the entire wholesale milk trade of the country. The committee, however, recognized that steps should at once be taken to determine the basis on which the interests concerned could be acquired should this be deemed advisable. The inquiry would involve the consideration of compensating the interests concerned for any damage done to them by control, without actually purchasing such interests.

THE FUTURE OF THE MEDICAL PROFESSION.

THE Cavendish Lecture of the West London Medico-Chirurgical Society, on the future of the medical profession, will be given by Major-General Sir Bertrand Dawson, G.C.V.O., C.B., M.D., on Thursday next, July 4th, at 8.15 p.m. It is, we understand, Sir Bertrand Dawson's intention to deal with the subject in a comprehensive way, since he is of opinion that the progress of knowledge and the needs of the community have combined to render the present organization of the medical profession in many respects inadequate. Preventive and curative medicine should be closely related in thought, teaching and organization, and the earlier preventive treatment of disease must come to occupy a more prominent position. The investigations which must be made to this end will call for special equipment and collective rather than individual effort. Sir Bertrand Dawson believes that an increase of special institutions is necessary, and he will consider at length the various types required. All members of the medical profession are invited to attend the lecture, which will be given at the West London Hospital, Hammersmith, and it is hoped that laymen interested in the subject will also feel disposed to be present.

THE OXFORD OPHTHALMOLOGICAL CONGRESS.

THE Oxford Ophthalmological Congress will hold its ninth annual meeting at Oxford on Thursday, July 11th, and Friday, July 12th. As in former years members will be accommodated in Keble College, but as the number of rooms available is limited application should be early made to the Secretary. The proceedings will take place in the department of Human Anatomy in the University Museum, kindly lent for the purpose by Professor Arthur Thomson. The scientific and commercial museums will also be held in the same building, which is close to Keble College. The members will meet informally at dinner in the College at 8 p.m. on Wednesday, July 10th. On Thursday morning the Master of the Congress, Mr. Sydney Stephenson, will welcome the members at 10 o'clock and will give an address on the history of the Congress. Sir William Collins will deliver the Doyné Memorial Lecture, and will afterwards open a discussion on ophthalmology and the war, in which the following will take part: Lieut.-Colonel R. H. Elliot (London), Captain E. H. E. Stack,

Miss Marion Gilechrist (Glasgow), Dr. Charles Killick (Maidstone), Dr. T. Harrison Butler (Leamington Spa), Major G. H. Pooley, Mr. V. Cargill (London), Captain P. H. Adams, Captain Percival J. Hay, Captain Thomson Henderson, Major Cecil Clements, Mr. Bernard Cridland (Wolverhampton). On Friday, July 12th, papers will be read by Sir William Barrett, F.R.S. (London), Colonel S. Hanford McKee, C.M.G., C.A.M.C., Lieut.-Colonel R. H. Elliot, Dr. T. Harrison Butler, Captain Thomson Henderson, and Captain Percival J. Hay. In the scientific museum demonstrations of new ophthalmic apparatus will be given by Sir William Barrett and others, and there will also be on view a collection of pathological specimens, photographs, and radiograms. On the same afternoon cases will be shown at the Eye Hospital by Captain P. H. Adams and others, and a discussion will follow. Those desirous of attending the Congress are requested to communicate with the honorary secretary, Mr. Bernard Cridland, at Salisbury House, Wolverhampton.

THE usual half-yearly indexes to the JOURNAL and to the SUPPLEMENT have been prepared and will be printed. They will, however, not be issued with all copies of the JOURNAL. Any member or subscriber who desires to have one or both of the indexes can obtain a copy of what he wants, post free, by sending a post-card notifying his desire to the Acting Financial Secretary and Business Manager, British Medical Association, 429, Strand, W.C.2. Such copies will be despatched shortly after the middle of July.

WE commend to the special notice of our readers the letter on page 735, in which Sir Rickman Godlee makes a moving appeal on behalf of the Belgian doctors in Belgium.

Medical Notes in Parliament.

National Service Medical Boards.

MEDICAL boards and the National Service system of grouping were criticized in the Vote of Credit Debate in the House of Commons on June 20th.

Sir Herbert Nield, chairman of the Middlesex Appeal Tribunal, maintained that Grade I for the older men was the equivalent of Class A under the earlier system for the younger. Further, he said, there was no guarantee that once a man was in the army he might not be put to any service duty, and it was therefore the more important on that account that a man should be sure of his category upon going into the army. He regretted that the memorandum containing twenty-four specific directions that the medical board, in grading under the head of Grade III, could sub-divide so as to indicate whether a man should be put to auxiliary service or labour or sedentary occupations, was withheld from the tribunals. Within the last four weeks four hundred applications had been made in Middlesex for appeal from the medical board to the medical assessors. Since November, no fewer than 30 per cent. of such applications in Middlesex had resulted in reduced grading.

Sir Donald Maclean, replying to an observation made by Sir Auckland Geddes last week, quoted words from the circular of the Ministry of National Service, wherein it was said that "Grade I is generally equivalent to Category A, General Service, of the old classification." Such a system did not test men as to their physical fitness for the work of the army, but applied a physical test as to whether men were in Grade I of their particular range of ages. The proper test, he insisted, was the old A classification, which had worked admirably. It had worked so well that the Appeal Tribunal of which he was chairman had sent down without the slightest fear any number of cases to the ordinary medical board. Now, however, Grade I was not to be Grade I according to physical fitness but Grade I of age, and that, he held, was trifling with the House. The Grade I man, as he was at present being passed, was a Grade II man of the old and proper standard, and a Grade II man of the new standard approached nearly every time to a Grade III man of the old standard. If men were going to be put into the army on the lines of Grade I and Grade II as now set forth, all the men of the other class should be re-examined and sent into the army as well as men of 44, 46, and 48. Out of 132 applications with which the London War Pensions Committee had to deal, in no fewer than 87 the reason for discharge from the army—sickness or physical disability—was stated not to be caused by or aggravated by army service. These men had no sort of appeal to the Government for monetary assistance and no right to a pension. They ought not to have been in the army. The complaints from which

they were suffering included chronic bronchitis, deformed ankle, deformed foot, hernia, phthisis, tuberculosis, chronic suppuration.

Sir Auckland Geddes, in his reply, said that the terms Grade I, Grade II, Grade III were introduced to convey a different meaning from categories A, B, and C, and they were defined differently, but in order that during the period of transition there might be some linking up between the old system and the new, general equivalents were stated for the men of the ages then under consideration. This was last autumn. These general equivalents had no bearing, and could have no bearing, in the case of men who had never been categorized. Men who had been graded were graded in accordance with the principles laid down, and the definitions of those grades had been most carefully drawn up. The instructions giving all the conditions that should exclude and the conditions which should allow a man to be included in any grade filled twenty-eight pages. The clause had been quoted which said that men who fulfilled the conditions named for Grade I were fit for general service in the army, but there was also the instruction that the physical training of the men was to be carried out under medical supervision. The system under which the service was working had been misunderstood. Every man required two indices to place him in the proper place in the posting chart. He required his grade and then his age, and it was the combination of grade and age which settled a man's place in the square and the service he was to render. The actual posting was a matter for the War Office, but the two departments worked closely together. The only thing that medical men could do was to judge upon the physical signs whether he was reasonably fit for his age. The system was introduced last autumn, and, according to Sir Donald Maclean, had worked satisfactorily then. Therefore it did not seem to him that the system was wrong. He admitted, however, quite freely that the results of the medical boards of the last few weeks had given grave cause for anxiety. He reminded the House of the very great number of examinations being carried out. A very large number of medical men were being employed—thousands—and a quarter of an hour of medical time was allowed for every examination. It was not possible to examine every man in a quarter of an hour, nor was it necessary to examine every man for a quarter of an hour. Many cases could be dealt with in two or three minutes, because the man was either rejected or was obviously of the lowest grade which could become available for service. Men in Grade III of the new age period were not being called on, so that it was not necessary to submit them to an elaborate examination. It was about six or seven weeks since he first became alarmed as to what was happening at some of the medical boards. In the last few weeks he had visited twenty-four places in different parts of the country, and he could say that in the country as a whole the work that was being done was eminently satisfactory. Sir Auckland Geddes next referred to a letter by the Commissioner for the London region issued on May 3rd, wherein it was stated that the medical board was to be cut down to two members and the president, and that the men were to be examined by one examiner, who was to refer questions of doubt to his colleagues. This letter was a most unfortunate mistake, but a copy reached the Ministry in the ordinary routine, and the Chief Commissioner at once had it cancelled. He interviewed the Commissioner for London, who at once summoned the whole of the chairmen of the medical boards, explaining that a mistake had been made. The reason for different results by London boards was, he thought, that every one had felt the pressure of the German offensive. There had been no difference in the instructions, but it had been found necessary to slow down the London board. In conclusion, Sir Auckland complained that there had been a good deal of unfair criticism, but claimed that on the whole good work was being done.

Mr. Tennant, in a few friendly words, said he should be very sorry to add to the difficulties which Sir Auckland Geddes had to face, but he thought it was imperative that the medical boards of the National Service Ministry should choose only men who were fit for positive duties in any part of the field in France unless they were earmarked for work behind the lines, or were not allowed to go to the front at all.

It was agreed that the vote for the Ministry of National Service should be put down for June 27th, and that the discussion should then be resumed.

Maternity and Child Welfare Bill.

SECOND READING DEBATE.

The second reading of the Maternity and Child Welfare Bill was moved in the Commons on June 24th by Mr. Hayes Fisher. As already stated, it proposes to extend to England and Wales powers already enjoyed by local authorities in Scotland and Ireland, which in Scotland have proved of considerable benefit. The policy had originally been worked out by voluntary effort, but every year it had grown more popular with local authorities. In 1914-15 the expenditure by local authorities was £10,439, and by voluntary bodies £1,049. In 1917-18 the expenditure by the local authorities had jumped up to £92,985, and that of voluntary bodies to £29,331. The sum voted by the House of Commons for the present financial year was £230,000, or nearly double. The scheme of the bill was that any local authority to which the Act applied might make arrangements, subject to the approval of the Local Government Board, for attending to the health of prospective and nursing mothers and of children under 5 years not being

educated in schools provided by the Education Board. He believed that it was better to have schemes operating over large areas; but it was left to the Local Government Board to say, after consulting the county councils, whether particular powers should be exercised by a county or a district council. Each council exercising the powers was to set up a committee to which powers might be delegated, and it was recommended that something like one-third of each committee should be co-opted from persons with special knowledge of the subject. Under the bill the authorities would be able to provide crèches and day nurseries. They would also be able to establish convalescent homes for nursing mothers and children under 5 years. They would be able to establish homes and make other arrangements for attending to the health of children under 5 years old of widowed, deserted, and unmarried mothers. Another power was to provide home helps and other assistance for securing proper conditions for the confinement of necessitous mothers. Authority would also be given to provide midwives and maternity nurses for necessitous women, and for areas in need of this service. Lastly, direct authority was given to provide maternity and welfare centres. Some authorities showed timidity in exercising their powers; the bill would secure them. Mr. Fisher said he had visited a perfect maternity and welfare centre. It had a whole-time doctor, four health visitors, a dental clinic, a hospital for the more difficult cases of confinement, a centre to which pregnant women could go for advice, and a centre from which food and milk could be distributed under the certificate of the M.O.H. to women who were necessitous or who could not obtain proper food and milk for their condition. The centre also had a maternity home in which were sixteen beds. If used for a fortnight by each mother they would provide for 240 women a year. The whole expense to the borough was only a farthing rate. Referring to the opposition which came from those who thought that the passing of the bill would prejudice the introduction of a bill for a Ministry of Health, he said that the bill was not a substitute for the Ministry of Health Bill, which in its main outlines had been approved by the Government; this would be proceeded with, but adequate time must be given to it, and it could not be dealt with this session, but there might be an autumn session. He pleaded with members, while using all their efforts to get a Ministry of Health Bill passed, not to delay the passage of this little measure. The powers under it would afterwards pass to the Ministry of Health.

Major Astor moved the rejection of the bill, on the ground that it would be unsatisfactory unless accompanied by the establishment of a Ministry of Health, which, he submitted, might be set up by a three clause measure. The first clause would put under one head the Local Government Board and the Insurance Commission; the second and third would give power to transfer to it the health functions of other Government departments, and to transfer from it the non-health functions transferred to it by the first clause. The non-health functions of the Local Government Board could be transferred to the Home Office. Major Astor spoke at some length on the present separation of various health functions under different departments and of the overlapping of such work. The Minister of Reconstruction had been reported as saying some time ago that he thought he had got substantial agreement upon the Ministry of Health, and would be ready to introduce the bill. Lord Curzon, speaking recently, was understood to have said that the establishment of the Ministry of Health was being delayed by departmental jealousy. If so, was not this a case for intervention by the War Cabinet? The rejection having been seconded by Major Hill, Mr. Anderson (Labour), while agreeing that Mr. Hayes Fisher would have done better to bring forward a larger measure, thought the matter could not be allowed to wait. Sir H. Harris also felt that there was a certain value in the bill, which should not be lost. Mr. Walsh renewed the definite promise made by him on behalf of the Local Government Board that the measure would in no sense whatever be used to prevent the bringing in of a larger measure, and the second reading was given.

Veneral Disease: Regulation 40 D.—In reply to Mr. Lees Smith, on June 25th, Mr. Macpherson stated that the War Office Conference on Venereal Disease, of which he was chairman, included amongst its members the Archbishop of Canterbury, the Rev. Dr. F. B. Meyer, and Lord Sydenham, in addition to representatives of the French military authorities, the American army and navy, the Dominions, and the British navy and army. In the course of a short debate, on June 19th, Mr. Macpherson stated, in regard to Regulation 40 D, issued under the Defence of the Realm Act, that he had arranged this conference to consider what further action could be taken to prevent the spread of venereal disease amongst soldiers. Regulation 40 D constituted it an offence for a woman to communicate venereal disease to soldiers or sailors. The regulation had been made in consequence of representations by the Dominion authorities at the last Imperial Conference. He denied that under the regulation women might be taken up for solicitation. The power for arrest on such charge obtained under the existing law. The Government believed that the regulation was useful and might prove effective, and therefore he could not say it would be withdrawn. He did not allow that the disease was more prevalent amongst the military than amongst the civil population. Mr. Macpherson added, in reply to further questions on June 25th, that he thought that the Conference was thoroughly representative, and he was not disposed to add representatives of women's organizations.

THE WAR.

CASUALTIES IN THE MEDICAL SERVICES.

ROYAL NAVY.

Wounded.

Surgeon G. E. D. Ellis, R.N.

ARMY.

Killed in Action.

CAPTAIN P. B. SEWELL, A.A.M.C.

Captain Phil. B. Sewell, A.A.M.C., whose death in action we announced in our issue of May 25th, enlisted immediately on passing his final examination at Melbourne University in 1916. He proceeded to France in August last, and served with a field ambulance and an Australian infantry battalion. While accompanying the latter into action on the night of April 24th-25th he appears to have been hit by a machine-gun bullet. His commanding officer writes of his efficient work throughout the winter in watching over the health of the battalion; in all operations he proved himself a gallant, cheerful, and capable officer and a good comrade.

LIEUTENANT A. M. CLARE, R.A.M.C.

Lieutenant A. M. Clare, R.A.M.C. (formerly C.A.M.C.), was reported as killed in action, in the casualty list published on June 19th.

Died of Wounds.

CAPTAIN R. A. PRESTON, R.A.M.C.

Captain Richard Amys Preston, M.C., R.A.M.C., died on June 7th, of wounds received the same day, aged 27. He was the second son of the late Mr. H. E. Preston, M.I.C.E., and was educated at the London Hospital. He took the diplomas of M.R.C.S. and L.R.C.P.Lond. in 1914, graduated M.B., B.S.Lond. in the same year, and afterwards filled the post of assistant house-surgeon of the Poplar Hospital. He joined the Special Reserve of the R.A.M.C. as lieutenant on August 6th, 1914, two days after war was declared, and was promoted to captain after a year's service. On February 5th, 1917, he took a permanent commission as lieutenant in the R.A.M.C., was promoted to captain a year later, and for some time past had been acting as a temporary lieutenant-colonel. He received the Military Cross on June 23rd, 1915.

Died on Service.

CAPTAIN D. T. O'FLYNN, R.A.M.C.

Captain Dominick Thomas O'Flynn, R.A.M.C., died of appendicitis, on service abroad, on June 16th, aged 35. He was the fifth son of the late Mr. Edward O'Flynn of Cork, was educated at Queen's College, Cork, where he was senior medical exhibitor, and took the diplomas of L.R.C.S.I. and L.R.C.P.I. in 1906. He took up the asylum service, and held the post of assistant medical officer at the Isle of Man Asylum, and at the London County asylums at Cane Hill and Hanwell, successively. He took a temporary commission as lieutenant in the R.A.M.C. towards the end of 1915, and was promoted to captain after a year's service.

The casualty list published on June 24th reports the deaths on service of Captains J. T. W. Boyd and W. F. Hale, both of the Canadian Army Medical Corps.

Wounded.

Major C. W. M. Hope, R.A.M.C. (temporary).
 Captain A. E. A. Burkhardt, R.A.M.C. (temporary).
 Captain J. M. McCloy, R.A.M.C. (temporary).
 Captain E. S. Meyers, Australian A.M.C.
 Captain F. J. Miller, Australian A.M.C.
 Captain C. G. Templeman, Australian A.M.C.
 Captain G. W. Will, R.A.M.C. (temporary).

Missing.

Captain F. C. H. Bennett, R.A.M.C. (temporary).
 Captain J. M. Mackenzie, M.C., R.A.M.C. (temporary).

Prisoner of War.

Captain A. H. Little, R.A.M.C. (temporary).

DEATHS OF SONS OF MEDICAL MEN.

Goodchild, Stewart John, Second Lieutenant R.S.L.I., reported wounded and missing on March 28th, but later reported killed in action. He was the eldest son of Dr. N. J. Goodchild of Highgate.

Johnston, Paul Hedley, Lieutenant R.F.A., only son of the late Dr. J. H. Johnston of Nottingham, died of wounds, June 11th, aged 20.

Quill, Maurice Desmond, Captain Royal Marine Artillery, elder son of Surgeon-General R. H. Quill, A.M.S.(ret.), of Cheltenham, died of fracture of the skull caused by a fall from his horse, at the Royal Naval Hospital, Haslar, on June 17th, aged 22. He got his commission in October, 1913, was mentioned in Lord French's dispatch of November 30th, 1915, and was promoted to captain in November, 1917.

[We shall be indebted to relatives of those who are killed in action or die in the war for information which will enable us to make these notes as complete and accurate as possible.]

HONOURS.

AMONG the recipients of honours for meritorious services (Supplement to the *London Gazette*, June 21st) are the following members of the medical profession:

D.S.O.

Surgeon (Acting Staff Surgeon) Edward Leicester Atkinson, R.N.

In recognition of his services as Senior Medical Officer of the R.M.A. Howitzer Brigade since May 26th, 1916. He has carried out his duties with the greatest zeal and energy, and has shown an excellent example by his fearlessness and devotion to duty. He has been twice wounded, and would have been relieved but for his strong desire to remain at his post.

Surgeon (Acting Staff Surgeon) William Bradbury, R.N.

In recognition of his services with the Royal Naval Division in Gallipoli and France. As Medical Officer of the Hawke Battalion, Royal Naval Division, in Gallipoli, he did exceptionally good work, often under the most trying circumstances.

Distinguished Service Cross.

Surgeon Henry Brice Parker, R.N.

In recognition of the exceptionally good work done by him as Medical Officer of the Nelson Battalion, Royal Naval Division, in Gallipoli.

The following awards are announced in a Supplement to the *London Gazette*, dated June 22nd, in recognition of "conspicuous gallantry and devotion to duty in the field":

D.S.O.

Captain (Acting Lieut.-Colonel) Robert Bernard Price, R.A.M.C.

Prior to the division going into action he took over the duties of Assistant Director of Medical Services at half an hour's notice. When on one occasion all casualty clearing stations in the neighbourhood of the division were withdrawn, his improvisation on the previous night of an emergency casualty clearing station further to the rear proved of such inestimable value that a large number of casualties were able to be dealt with, and all the wounded evacuated with the utmost dispatch. Owing to his resource, forethought, and exceptional powers of organization, the smooth and successful evacuation of all wounded was carried out during the period of twelve days' heavy and continuous fighting in which the division was engaged.

Bar to the Military Cross.

Captain John Henry Pearson Fraser, M.C., R.A.M.C.

During the evacuation of a town he was in charge of a train loaded with stores and equipment. While the train was standing in the station without an engine it was heavily bombed by enemy aeroplanes. With bombs falling all round he secured an engine, which had just backed into the station and coupled it to the train. He then collected a few men and cleared the permanent way of masses of debris caused by the bombs, and eventually got the train away safely under continual bombing by enemy aeroplanes. By his courage, determination, and resource in a most difficult situation he succeeded in saving the whole trainload of equipment. (M.C. gazetted February 4th, 1918.)

Temporary Captain Frederick Theophilus Hill, M.C., R.A.M.C.

Several hundred casualties of all branches of the service were passed through his unit during the day, and were evacuated promptly, thanks to his zeal, energy, and efficient organization. When the enemy were advancing his unit was the last to leave the neighbourhood, and finally withdrew, when ordered to do so, and when every case had been evacuated, to join the division. He displayed outstanding devotion to duty. (M.C. gazetted June 23rd, 1915.)

Captain (Acting Major) Herbert Stewart Milne, M.C., R.A.M.C.

When in charge of an advanced dressing station, in spite of continuous shelling, he dressed and superintended the evacuation of the wounded during three days' operations with great success. When a shell fell among a party of men, killing three and wounding fourteen of them, he succeeded in dressing the more severely wounded and in getting them all removed to a place of safety before the next burst of fire fell in the same spot. By his courage and resource he undoubtedly saved a further loss of life. (M.C. gazetted June 3rd, 1916.)

Temporary Captain Matthew Arnold Swan, M.C., R.A.M.C.

When the majority of his stretcher-bearers had become casualties and his advanced post had received two direct hits from shells he stayed at his post, dressed the wounded and supervised their evacuation. On many other occasions he has shown the greatest courage, coolness and initiative, and his conduct has at all times been exemplary. (M.C. gazetted June 3rd, 1916.)

Temporary Captain Warren Fullerton Clark, R.A.M.C.

Whilst the battery was being heavily shelled two men were badly wounded. He at once proceeded out into the open, attended to these men under the most intense shell fire, carried them into a trench, and remained with them until an ambulance arrived. He showed magnificent coolness and an utter disregard of danger.

Temporary Captain John Norman Cruikshank, R.A.M.C.

He attended to the wounded under heavy fire during an enemy attack. His skilful organization of stretcher-bearers and his coolness and determination in a most difficult situation resulted in the saving of many lives.

Temporary Captain Andrew Ferguson Horn, R.A.M.C.

He led his bearers forward to the front line during a heavy enemy attack and brought back many severely wounded men through the enemy's barrage. Throughout the operations he displayed splendid coolness and courage under heavy fire.

Captain John Francis Hill, R.A.M.C. (S.R.).

He worked through out the day under incessant shell fire, attending to the wounded during an enemy attack. Owing to his coolness and skill in a most difficult situation, many lives were saved.

Quartermaster and honorary Captain R. D. Matthews, R.A.M.C., is awarded the Military Cross for conspicuous gallantry and coolness during a hostile bombing raid.

Surgeon Andrew Harman Pearce, R.N., is among the officers mentioned in dispatches (*London Gazette*, June 21st).

Surgeon-General James L. Smith, C.B., M.V.O., R.N., has received the decoration of Officer of the Legion of Honour conferred upon him by the President of the French Republic.

The *London Gazette* of June 25th notifies that in the list of appointments to the Order of the Companions of Honour announced on June 3rd the name of Sir Frederick Treves, Bt., G.C.V.O., C.B., should be omitted at his own request.

NOTES.

AUXILIARY HOSPITALS AND THE USE OF CRUTCHES.

"M.O." writes that men sent from general to auxiliary military hospitals sometimes return from the latter in worse condition than they went, owing, as he thinks, to injudicious coddling by well-meaning ladies. Some are thus made neurasthenics. But the special point he makes is that the men may be allowed unnecessarily to use crutches until the knee becomes ankylosed in semiflexion and the foot dropped.

INVALIDING IN THE AUSTRO-HUNGARIAN ARMY.

The Austro-Hungarian Minister for War stated in December, 1917, that with every year of war the "general percentage of recoveries" had improved. In the first year it was 78 per cent., in the second year 83 per cent. In the first year 13.5 per cent. of the casualties proved fatal at the front, 2.2 per cent. at home. In the second year these figures were reduced to 7.7 per cent. and 1.7 per cent. respectively. The incidence of cholera, typhus, and typhoid fevers and dysentery was reduced by about one-half in the second year as compared with the first. Owing to the invasion of Albania, the incidence of malaria had doubled in this period, and measures had been taken to prevent the introduction of malaria to the Monarchy. The incidence of trachoma and venereal disease also showed a rise. From other statements it appears that down to December, 1917, about 200,000 Austro-Hungarian soldiers were classified as "invalids." This figure represented 20 per cent. of all cases undergoing "after-treatment" (*Nachbehandlung*). That 80 per cent. of soldiers subjected to "after-treatment" should have been sent back to the army is claimed as a success. Only a small fraction of the 200,000 invalids were totally unfit for work. Of all the wounded, about 85 per cent. returned to the colours, 10 per cent. to their former occupations, and only 5 per cent. were invalided; and of these, again, only a fraction was totally invalided.

APPARATUS FOR FRACTURES.

Before the war Miss Grace Gassette was an artist in Chicago. Very early in the struggle she joined the nursing staff of the American Hospital at Neuilly. There her capabilities as a deviser of splints and her powers of organizing a workshop were happily discovered and utilized, and she became the head of the department of dressings and apparatus. The exigencies of the war having taken away the orthopaedic mechanicians from the Paris hospitals, and the French surgeons also having become dissatisfied with the usual methods of treatment of compound fractures, nerve injuries, and the like, Dr. Paul Reynier asked Mrs. Anstui, the Vice-President of the American Committee, for help. Miss Gassette thereupon organized and took over the technical direction of the workshops of the Franco-American Corrective Surgical Appliance Committee, which has since sent out more than 10,000 apparatus for the treatment of fractures, and altogether more than 30,000 separate appliances. The principles of the suspension-extension apparatus, largely based on the work of H. O. Thomas, and the overhead bed frame used at Neuilly, are now pretty well known to orthopaedic surgeons. They are described in a communication made to the French Academy of Medicine by Dr. Paul Reynier¹ and in a pamphlet by Dr. Gaston Houzel,² published by the Franco-American Committee. The illustrations in both articles make clear the nature and use of these appliances. Dr. Reynier says that some of the apparatus are entirely of Miss Gassette's own invention; others have been so simplified and modified by her that she may fairly claim them as her own.

Correspondence.

THE BELGIAN DOCTORS' AND PHARMACISTS' RELIEF FUND.

SIR,—The Belgian doctors in Belgium are in great distress, and I have been asked to put their case before your readers. I know that it is not a favourable moment, because the members of the Association have been so recently canvassed for the special appeal of the Royal Medical Benevolent Fund; moreover, living is dear, and the tax-gatherer is always knocking at the door. But the matter is urgent, as they will see if they read this letter to the end.

In 1914, when the needs of the Belgian doctors and pharmacists were proclaimed by the committee of which I am the chairman, there was a noble and generous response from the doctors and pharmacists in this country and the Dominions. Nearly £20,000 was raised before the end of 1916, but now our coffers are almost empty, and, in spite of our repeated efforts, in which you, Sir, have most kindly helped us, the flow of subscriptions has almost stopped. I will explain how the money has been spent and why we are asking for more.

At first we had to assist the Belgian doctors and pharmacists who had fled to this country, but for a long time their requirements have been trivial. In 1916, at the earnest entreaty of Mr. Herbert Hoover, who at that time was the Director of the Commission for Relief in Belgium, we began to send every month £800 to a committee in Brussels called the Aide et Protection aux Médecins et Pharmaciens Sinistrés Belges. These monthly remittances were continued until January, 1918, but since then they have been reduced to £400, and if we cannot raise more funds, even these must stop after July.

Do British doctors and pharmacists really know (1) that money is urgently needed, (2) that it goes to Belgium, and not to doctors and pharmacists in this country, and (3) that it really reaches the Belgians and is not pocketed by the Germans? If they did they would surely never allow these remittances to be stopped.

In order to satisfy those who may be holding back because they have their doubts on these three points, we have obtained the most recent information from the Commission for Relief in Belgium. Writing on June 18th, Mr. Lewis Richards, the Assistant Director, says:

There has been no change in the method of sending in these subsidies, a method with which your society is already familiar. I need hardly remark that the charities thus in receipt of subsidies through our channels are most carefully administered, and there is no possibility of any leakage on the way. I would like, however, to repeat—nor can we emphasize this point too strongly—that the need of help for Belgium grows with every day and the reports which we receive from all branches of the work are nothing short of heartrending. In this connexion we think you will be interested in reading an appeal which we recently received from a commission of doctors in Belgium, asking for various medicines. You will see from this letter the difficulties against which the medical profession in all its branches have to contend.

Your fund is one which reaches a class which cannot be helped in any other way. For the most part the professional men are too proud to come to the public soup-kitchens, and after four years of terrible privation any little savings which they may have had are by now exhausted. But they will and do most gratefully receive help from your fund, and with the assistance thus given them goes a most comforting feeling that their happier colleagues overseas are not forgetting them, a feeling which brings moral support, as money brings them material comfort.

We most warmly beg you to continue your splendid support to the Belgian doctors and pharmacists, whose need is unquestionably terrible, and whose gratitude, although under present conditions it cannot be expressed directly to you, is most real and heartfelt.

The appeal which he encloses is a request "for the importation into Belgium of a certain amount of medical supplies of both vegetable and chemical origin, of which there is a total lack, and the absence of which constitutes a real danger to the public health." It is supported by a precise explanation of the manner in which the needs of the population are gauged, and of the way in which the distribution is carried out.

This document has determined our committee, though reluctantly, to approach the general public. It has been asked why the public should assist the medical more than

any other profession, but it may be answered that doctors adequately provided with drugs are essential for the maintenance of the health of the people, and the limitation of those epidemics which are common when starvation and oppression go hand in hand. May I suggest that if your readers would not only themselves give what they can spare, but would make personal appeals to their wealthy and benevolent patients and friends, the difficulties of our committee might be overcome?

We need a large sum; but it is to pay a debt owing to our hardy entreated brothers. Do we forget that they are in these straits because they are citizens of a country which, in 1914, with nothing to gain except the world's respect, and everything except their honour to lose, stopped the German rush and so saved this Empire and France and civilization from a catastrophe the magnitude of which we perhaps even now do not altogether appreciate?—I am, etc.,

RICKMAN J. GODLEE,
Chairman of the Belgian Doctors' and
Pharmacists' Relief Fund.

London, W., June 24th.

Subscriptions may be sent to the Honorary Treasurer,
Dr. H. A. Des Vœux, 14, Buckingham Gate, London, S.W.

MILK SUBSTITUTES.

SIR,—May I now clear up some difficulties in the preparation of a liquid food from oats? It is evident that when there is a shortage of cow's milk we require for many invalids, and indeed for others, a food which is at once a liquid, very easily digestible, inexpensive, very easily prepared, and without any strong flavour. It need not be a complete food, any more than cow's milk is, for it would not often be the sole food, except temporarily, as in brief febrile states.

Such a food can be most simply made from oats as follows:

Instructions.—Boil three ounces of fine oatmeal in a double saucepan for at least an hour. Then cool to 140° F., and stir in two or three teaspoonfuls of extract of malt, or of finely ground malt. The jelly-like mass will quickly change to a syrupy liquid. Let it remain for an hour at the same temperature. It is then ready for use, and should measure one pint.

This liquid oatmeal has much the same composition as cow's milk, except that there is a deficiency of fat and some little of protein. It has lost most of the oatmeal flavour. It is not so white as cow's milk, but the cost for materials is clearly little if anything over a penny a pint. F. W. Rixon, Ph.D., of the University of Bristol, gives the approximate values of a properly made specimen as:

<i>Liquid Oatmeal.</i>		<i>Average Cow's Milk.</i>	
Total solids	13.1 %	...	12.6 %
Protein	2.3 %	...	3.4 %
Fat	1.0 %	...	3.74 %
Maltose	6.7 %	Lactose	4.7 %
Sugar	3.2 %
Mineral matter	0.27 %	...	0.75 %

Slight variations, due to the kind and quality of the meal used, may occur.

The shortage of fat cannot be made up from oatmeal alone, for oats themselves do not contain the quantity required. If we wish for a good material having practically the same composition as cow's milk some other substance must be added. Dr. Rixon suggests the addition of one ounce of crushed peanuts as almost the only available source in the present war time of protein and fat. This gives a better milk, but doubles the cost, as peanuts are 1s. 4d. a lb. We can make up the deficiency of fat again by cooking with it half an ounce of cocoa fat, if the chocolate flavour is appreciated. The extra cost will be three farthings a pint, but the fat is not emulsified. Some improvement in smoothness and taste can be obtained by straining through muslin and squeezing the residue dry, especially if a fine oatmeal cannot be got. However, the process is not only tedious and apt to lead to errors, but in any case it results in a great loss of protein and mineral matter. Hence straining should be avoided and a well-ground fine oatmeal used.

The liquid may be drunk as it is, or mixed with cow's milk. For some purposes an inexpensive flavouring agent may be desired. A vanilla nut may be used several times over, or a drop of the extract, lemon rind, or bay leaves will serve the purpose. In the absence of a thermometer the temperature of 140° may be judged by noting that a finger can just be dipped in the mass without pain.

I do not suggest that liquid oatmeal has all the physiological properties of cow's milk, or that it can replace it as a food for young children or in special diseases, but it is undoubtedly a valuable food. In conclusion, I have to thank Drs. O. C. M. Davis and Rixon and other experts for most kind advice and assistance in the various trials we have made.—I am, etc.,

Clifton, Bristol, June 24th.

GEORGE PARKER.

THE RELATION BETWEEN HEAT-STROKE AND MALIGNANT MALARIA.

SIR,—Having read Captain C. E. H. Milner's interesting article (June 8th, p. 638) on the close relation between heat-stroke and malignant malaria, and seeing that he expects—and, indeed, invites—adverse criticism, I have ventured to enter the field.

I have had five years' experience of heat-stroke cases and malaria in North-West Punjab military cantonments, especially Mian Mir. It has been my opinion that heat-stroke and malignant malaria are separate and distinct diseases, though everyone knows that a case of malaria may develop heat-stroke.

Captain Milner's charts would suggest plasmodium infection rather than heat-stroke, especially Chart 2. The usual uncomplicated heat-stroke case, seen just with temperature of, say, 110°, comes down under energetic treatment to about 102° in within half an hour or so; a few hours later the case is liable to relapse again, possibly twice; and if the temperature is once more successfully reduced it usually stays down—indeed, is often subnormal—and there is not a slight temperature for a few days as seen in Captain Milner's charts.

It has been my experience that a patient with true heat-stroke practically never reports sick, usually having been in fair health to the day on which he is struck down, or at most has been feeling out of sorts, and is found later lying unconscious.

On the other hand, the patient with crescents in his blood has usually been feeling and looking ill before the attack of hyperpyrexia comes on, and generally actually reports sick at hospital before he reaches the hyperpyrexial stage.

I have seen cases such as Captain Milner describes which I have thought to be heat-strokes until I found crescents in the blood, and in several fatal cases *post-mortem* examination showed cerebral blood vessels absolutely clogged with accumulated malignant malaria parasites, visible to the naked eye as a grey débris.

On the other hand, heat-stroke cases with nothing found in their blood before death have afforded no evidence of malaria in spleen or brain *post-mortem*. The blood was examined in all cases of hyperpyrexia, and if crescents were found the case was looked upon as a possible outcome of cerebral malignant malaria, and quinine was then used vigorously. Many cases of heat-stroke were new to the station, and gave no history of malarial infection.

I would like to know how Captain Milner accounts for cases of heat-stroke in soldiers who have not even risked infection, and who have developed heat-stroke a few hours after landing in India. I believe the troop train disaster in India, in which there were many fatal cases of heat-stroke, is a case in point. I certainly have seen many patients with heat-stroke who gave clear evidence of never having had malaria, and never having been exposed to infection.—I am, etc.,

H. BEADNELL, Major R.A.M.C.

St. Anne's-on the-Sea, June 12th.

PRECAUTIONS AGAINST THE SPREAD OF MALARIA.

SIR,—The importance of Dr. Fielding-Ould's statement (p. 683) that "quinine given with a rising temperature only tends to increase headache and malaise" cannot be too much emphasized.

I have confirmed this valuable clinical fact many times, and would have liked Dr. Fielding-Ould to have been more dogmatic in his statement.

Quinine positively does harm when so given, and in some cases will even produce haemoglobinuria. In districts where blackwater fever is prevalent it is of vast importance to recognize this, both as regards treatment and prognosis.

I am of opinion that the case mortality of true blackwater fever would be found to be very much higher were this differential diagnosis made, many cases of so-called blackwater fever being simply quinine poisoning. These cases nearly always do well under treatment, hence the importance of distinguishing them from that most deadly disease.

The prevailing custom of drenching every case of pyrexia in malarious districts, or patients who have formerly lived in malarious districts, is a very bad one. Quinine is our specific for malaria, and, if given scientifically, will cure the condition; but the diagnosis of malaria, as shown by examination of the blood and the presence of the parasite, should be established before quinine is given. Diagnosis first; then treatment, and by hypodermic injection.

If this procedure is systematically carried out we would hear far less of the inefficacy of quinine. I have one case particularly in mind—that of a man who was kept in hospital for a week suffering from gonorrhoeal septicaemia; he was treated with intramuscular injections of quinine. He left hospital of his own accord and consulted me. A few days' rest in bed, with active antigonorrhoeal treatment, brought down his temperature and stopped his sweats. This occurred in Nigeria.—I am, etc.,

STANDISH J. WATSON, M.B., B.Ch.,

Late Medical Officer, N. Nigerian Chamber of Mines.
Swansea Valley, June 19th.

ADAPTATION AND DISEASE.

SIR,—Professor Adami seems unable to appreciate the difference between the views published by him in 1901 with regard to the influence of internal secretions on the germ cells and the hormone theory published by me in 1908. This inability is probably due to the fact that he has never done me the honour to read my paper, and that he is not acquainted with my other researches and publications on the question of the influence of external conditions in evolution. My theory is concerned with the origin of definite structures and morphological characters, such as the antlers of stags; Professor Adami, as in his own quotations from himself, considered only "intoxications" and constitutional states, such as the gouty diathesis.

The term hormone is not merely, as Professor Adami supposes, another name for metabolites or internal secretions, but is a name given to internal secretions which were discovered by physiologists to have the function of acting as a special chemical stimulus on other organs, either causing glands to secrete, or actually determining the development of large and important structures. Thus the development of the antlers of stags and the secretion of milk after parturition were shown to depend, not on some obscure nervous stimulus, as formerly supposed, but on a chemical stimulus due to some substance produced by the generative organs. Professor Adami makes no allusion to facts of this kind in his paper of 1901. The fact that the development of antlers depends on an internal secretion from the testes led me to formulate the theory that the antlers originally arose from the inheritance of a hypertrophy caused by the mechanical irritation of skin and periosteum due to the fighting of the stags, and that this hypertrophy involved the production of additional "metabolites" which, acting on the germ cells, in time caused the hereditary development of the same hypertrophy. To assert that my theory was the "enunciation of conclusions reached by Adami in 1901 regarding metabolites and, as we subsequently became accustomed to term them, hormones, and their influence upon the germ cells," is a gross perversion, and the attempt in this way to transfer any credit due to me for originality to himself by virtue of his 1901 paper, was what I stigmatized as audacity.

My theory of 1908 was the logical sequel of the views published by me in 1900 in my book *Sexual Dimorphism in the Animal Kingdom*. In it I discussed the evidence for the conclusion that secondary sexual characters, at any rate in most cases, were the result of external stimulations and irritations, producing hypertrophy or modifications of growth which had become hereditary, but were only actually developed in relation to the functional activity of the generative organs. Long before this I published¹ a record of experiments which proved the production of pigment on the lower sides of flat-fishes under

the influence of light, results which in my opinion afforded indirect evidence that the absence of pigment on the lower side in normal flat-fishes was due to the heredity of the effect of an external condition.—I am, etc.,

London Hospital Medical College,
June 12th.

J. T. CUNNINGHAM.

* * We have referred this letter to Professor Adami, in order that a controversy which has already occupied much space may thus be brought to an end. Professor Adami writes as follows:

SIR,—The oburgation "*Pereant qui ante nos nostra*" is natural, and one with which all can sympathize. It is, nevertheless, not for publication, and the state of mind which evokes it, while it explains, does not excuse the employment and reiteration of offensive epithets.

The dominating problem of evolution during the nineteenth century, around which there raged the keenest controversy, was that of the inheritance or non-inheritance of acquired characters. Towards the end of the century it was becoming evident to some of the more acute and independent among the zoologists and botanists that purely morphological conceptions were inadequate to afford a solution. Thus, as he points out in his letter in your issue of June 15th, my old friend and teacher, at the end of the seventies, Professor M. Hartog, had, in 1898, recorded his opinion that the mechanism of heredity must be rather chemical than particulate. Mr. Cunningham, as he points out in the letter to which this is an answer, was in 1900 evidently verging towards like views.

To the best of my knowledge I was the first to publish, with the beginning of the new century, a definite chemical theory of inheritance based upon what we know regarding the constitution of complex organic substances. Doing this, I was the first to point out that through acquired alterations in the internal secretions the germ cells could become affected in their constitution along the same lines as were the body cells, and that through this endogenous and direct method we could comprehend the mechanism at work in the observed transmission of acquired constitutional states.

If, seven years later, Mr. Cunningham invoked the same mechanism of alteration in the internal secretions and their influence upon the germ cells to explain another order of inherited requirements, the priority in demonstrating the *modus operandi* of the direct or identical inheritance of acquired bodily states still remains mine. It is no argument to urge that constitutional states are vague and unsatisfactory. They may be so to the morphologist. But then the morphologist is not the only one concerned in the study of heredity. To the student of medical science these constitutional states—the gouty diathesis, the diabetic, the neurasthenic, etc.—are not merely real but widespread and matters of daily observation. Mr. Cunningham himself admits that certain internal secretions influence the growth and relative development of particular organs; it is alterations in these same internal secretions that are the basis of these constitutional states.

Whether or no others later arrived at the same conclusions independently—and quite probably they did—I am wholly justified in claiming priority, and because of that priority in speaking of these as my conclusions. The statement is strictly correct, and I repeat it, that since 1901 my conclusions regarding metabolites and their influence upon the germ cells have been enunciated by several prominent biologists, including Mr. Cunningham, without note of my earlier contribution.—I am, etc.,

London, W., June 24th.

J. G. ADAMI.

CEREBRAL OEDEMA.

SIR,—It is surprising that a paper so important as that on the above subject by Mr. L. Bathe Rawling (*JOURNAL*, May 4th) should so far have passed without comment. Mr. Rawling is surely to be congratulated on having written an article which is valuable from giving a tangible reason for symptoms which have hitherto been attributed to that rare but frequently diagnosed condition, "cerebral congestion." It throws an added light on oft misunderstood signs, objective and subjective, which have led to the suspicion and erroneous diagnosis of cerebral tumour, abscess, and tuberculous meningitis. He should be congratulated, too, on the success of his operations, particularly

¹ *Phil. Trans. Roy. Soc.*, 1893.

in those cases with the more pronounced epileptic symptoms, a success which points to a cause of epilepsy not often suspected, and to an adequate reason for the futility of the bromide treatment in cases arising from such cause. His paper, however, is disappointing in respect of the fact that we are kept completely in the dark as to the part the kidneys may play in the causation of cerebral oedema. Mr. Rawling has been too anxious to limit or circumscribe the entire source of the trouble to the cerebral area, though he mentions the absorptive capacity of the cerebral veins as being impaired by disease as well as by injury, and points out, though somewhat reluctantly, that toxic conditions of the cerebral fluid may be responsible for convulsive attacks. The basis of reasoning underlying statements of this kind should not have overlooked a possible defective activity of the eliminative powers of the kidneys, both as to water and to toxins, and so far from the primary cause, as Mr. Rawling suggests, being "(? temporary or permanent changes in the walls of the cerebral veins)," it would have been well, except in cases of heat-stroke or sudden injury, to have looked to the kidneys as much the more likely primary cause, leading to the disordered or diseased condition of the cerebral vessels as the secondary cause, with cerebral oedema as the ultimate result. Even in heat-stroke it is of the highest probability that the differences of resistance to this malady depend upon the healthy or unhealthy condition of the kidneys.

The scientific value of his paper would, therefore, have been immeasurably enhanced had he given the result of the systematic examination of the urine as to quantity, quality, and specific gravity. To have watched a case daily which he suspected to be one of cerebral oedema and to have ordered all the available narcotics, the effect of which was merely momentary and that of the slightest, suggests the thought that it would have been worth a trial to have prescribed some one or other of the available diuretics, and the effect might have been benefit of considerable duration provided the diuretic selected had been one of those which act without raising the blood pressure. In Mr. Rawling's cases the blood pressure rose to 140 of 150 mm. Hg, "no great rise" according to Mr. Rawling, but one would think such pressure distressingly high in a hot climate where the average blood pressure must necessarily be lower than normal. Hence it may not be unscientific to suppose that injections of pilocarpin with a view to its pressure lowering and diaphoretic effects or possibly a venesection, would have made all the difference between misery and comparative comfort to those patients who dreaded and refused operation.—I am, etc.,

Liverpool, May 25th.

WILLIAM BRAMWELL.

MAJOR-GENERAL SIR W. G. MACPHERSON, A.M.S.

SIR,—In connexion with the recent changes in the Army Medical Service in France, and the mention with appreciation of the distinguished services of the late Director-General Sir Arthur Sloggett, large numbers of the medical officers out here would have been gratified if the name of Sir William Macpherson had been coupled with him.

This latter officer has been constantly in touch with medical units, more particularly in the front areas, ever since he came to France; his genius for organization and keenness to improve the professional side of the work and untiring energy in every way will be sadly missed as time goes on.

The age limit has dealt a heavy blow to the B.E.F. medical service, which is the admiration of all, and for which little short of the lion's share has fallen to the lot of Sir William Macpherson.—I am, etc.,

June 18th.

TEMPORARY.

Major-General Sir W. G. Macpherson, K.C.M.G., C.B., who accompanied Sir Arthur Sloggett to France as Deputy Director-General Medical Services in 1914, has been appointed Deputy Director of Medical Services the Southern Command. This command covers a very extensive area, including the greater part of England south of the Thames and west of Portsmouth, as well as the counties of Warwick, Worcester, Gloucester, Oxford, and Buckingham.

PROX reports that he has observed good results from the use of adrenalin in patients suffering from dyspepsia with gastric atony. Discomfort, pain, and weight after meals disappear. He gives 8 or 9 drops of 1 in 1,000 solution.

Obituary.

WE regret to record the death, on June 22nd, of Professor HENRY GEORGE PLIMMER, F.R.S., past president of the Royal Microscopical Society, pathologist to the Zoological Society, and the first holder of the recently-founded professorship of comparative pathology in the Imperial College of Science and Technology. He was born in 1857, and studied medicine at Guy's Hospital, obtaining the diploma of M.R.C.S. in 1882. After serving as prosector in anatomy at the Royal College of Surgeons, he held for some years the posts of pathologist, bacteriologist, and lecturer on pathology at St. Mary's Hospital. He was the author of many important publications in English and German on microscopical science and comparative pathology, and did valuable work on the Sleeping Sickness Committee of the Royal Society. Beyond his scientific work, Professor Plimmer was a man of many and varied accomplishments; he was well known in the musical world as a distinguished student and performer, and his personal charm and kindness of heart endeared him to a wide circle of friends.

DR. JEREMIAH READER, of Wakefield, who died on May 29th, was born in 1854, and spent his childhood and youth at Winifirth, in Dorset. He was educated at Sherborne School, and at Guy's Hospital, and qualified in 1877. During his school and hospital days he was a fine all-round athlete. At Guy's he was one of the pioneers in developing the athletic side of student life, but none of these activities in any way distracted him from the serious work of his profession. His first practice was in Marshfield, Gloucestershire, where he held the post of district medical officer for the Chipping Sodbury Union, and, with the exception of a short interval after the sale of this practice, he was a Poor Law medical officer up to the time of his death, having held the appointment in the Wakefield Union for many years. He married in 1880; his wife and three children survive him. His two sons are in the medical profession, and both volunteered for active service at the beginning of the war, receiving commissions in the R.A.M.C. early in 1915. Dr. Reader's death was due to influenza and pneumonia. He had been overworked for some years, and the war added many worries to an already arduous practice. He is greatly lamented by the poor of the city, and the workers, on whom he spent himself.

DR. MILLER SEMPLE, who died at his residence in Dennistoun, Glasgow, on June 9th, aged 55, received his medical education at the University of Glasgow, where he graduated M.B., C.M.Glasg. in 1884, and at Dublin and Vienna. He had held the offices of resident surgeon and resident physician to the Glasgow Royal Infirmary, and for a long period was surgeon to the Steel Company of Scotland at Blochairn. He took great interest in medical administrative work in Glasgow, and was a member of the Glasgow Burgh Insurance Committee as well as of the Glasgow Eastern Division of the British Medical Association. Dr. Semple leaves a widow, two sons, and a daughter.

NEWS has been received of the death, on May 19th, at Nakuru, British East Africa, of Dr. REGINALD WESTMORE SPENCE. He was the son of Ernest Spence, One Tree Corner, Guildford, Surrey, and was born in 1886. From Epsom College he went to Westminster Hospital, and obtained the diplomas of M.R.C.S. Eng. and L.R.C.P. Lond. in 1913, was appointed medical officer under the Colonial Office, and was medical officer in charge of the hospital at Nakuru.

SURGEON-MAJOR-GENERAL CHARLES HERVÉ GIRAUD, A.M.S. (retired), who died as a result of a street accident at Fulham on May 10th, was born at Sevenoaks in 1834, and received his medical education at St. George's Hospital. Qualifying M.R.C.S. Eng. in 1858, he joined the Army Medical Service, and served at first as assistant surgeon on the staff, but was soon appointed to the 31st Regiment of Foot (the Huntingdonshire Regiment), now merged into the East Surrey Regiment. He became

surgeon-major in 1873, brigade surgeon in 1887, deputy surgeon general in 1889, and surgeon-major-general in 1894, being placed on half-pay in 1896. He saw much active service, serving in the Indian Mutiny with a flying column in the North-West Provinces, 1858-59. He was present at Sissaghat, and had the medal. In 1860 he was in China with the 31st Regiment, and was present at Sihlo and Taku, for which he had the medal with clasp for the Taku forts. From 1863 to 1864 he served against the Taepings, and was present at the storming of Kahding, Najow, Tsiupoo, and Nansiang. In 1879 he served with the 2nd Brigade in the Zulu war, and subsequently was P.M.O. to Clarke's column. He had the South African 1879-1881 medal with clasp.

Universities and Colleges.

UNIVERSITY OF LEEDS.

Chair of Pathology and Bacteriology.

AT the meeting of the council on June 19th, 1918, Captain M. J. Stewart, M.B., M.R.C.P., was elected Professor of Pathology and Bacteriology. Professor Stewart graduated in honours at the University of Glasgow in 1907 and was awarded the Brunton Memorial Prize as the most distinguished graduate in medicine of the year. After holding several hospital appointments in Glasgow, he was, in 1910, appointed clinical pathologist at the Leeds General Infirmary, and, in 1912, honorary demonstrator in clinical pathology at Leeds University. He received a commission in the R.A.M.C.(T.) in May, 1915, and has served as pathologist to the East Leeds War Hospital, and in a similar capacity in France. A few months ago he was recalled to Leeds and, at the request of the University Council, undertook the acting headship of the department of pathology and bacteriology. Professor Stewart has done much original research on pathological questions, including malignant disease.

ST. ANDREWS UNIVERSITY.

THE following candidates have been approved at the examination indicated:

THIRD M.B., CH.B.—Mildred Clark, Bessie M. Davidson, Jeao H. D. Fleming, Mabel Hodgson, Frances L. Knipe, Margherita M. Lilley, Kathleen M. Lyon, J. B. Macdonald, G. J. Murray, W. G. Robertson, Amelia MacD. Thoms, Olive M. Whyte.

Medical News.

To perpetuate the memory of the late Lieut.-Colonel Henry Moore, R.A.M.C., whose death from wounds we recorded last week, it has been decided to raise a fund to endow a bed in the Royal City of Dublin Hospital, where he spent the greater part of his professional life as a student, house-surgeon, and visiting surgeon. Many subscriptions have been promised, and those willing to assist in organizing the fund are asked to communicate with Mr. G. Jameson Johnston, F.R.C.S., Royal City of Dublin Hospital, Dublin.

THE London units of the Scottish Women's Hospitals for foreign service have decided that the memorial which they are raising to commemorate the late Dr. Elsie Inglis, shall take the form of a chair of medicine to be founded at Belgrade when the university in that city is reconstituted after the war. A London memorial fund for this purpose will be inaugurated at a meeting at the Mansion House, on Friday, July 5th. Applications for tickets should be made to 66, Victoria Street, S.W.1.

DR. NORMAN MOORE, president of the Royal College of Physicians of London, has been appointed a Radcliffe trustee.

DR. T. W. N. BARLOW (M.O.H. Wallasey), Dr. H. J. Gates (M.O.H. St. Helens), and Captain Frederick George Rose, R.A.M.C.T. officer commanding sanitary sections, Bagdad, have been elected Fellows of the Royal Sanitary Institute.

DR. F. COLE MADDEN, professor of surgery, Egyptian Government Medical School, and Mr. William M. Colles, professor, School of Medicine, Cairo, have been appointed members of the Order of the Nile of the third and fourth class respectively, conferred upon them by the Sultan of Egypt in recognition of valuable services rendered.

THE museum of the Royal College of Surgeons has been enriched this month by a fine series of instruments once the property of the late Mr. Arthur Durham, surgeon to Guy's Hospital, the donor being his son, Dr. Herbert Durham of Hereford. The series includes staphylorrhaphy, trachotomy, laryngotomy, and other knives, scissors, etc., devised and used by Mr. Durham, an auto-laryngo-

scopic mirror which he received from Señor Garcia, and Aston Key's own lithotomy case with a set of the straight staffs which he made use of with such dexterity. It will be placed next to the similar case and instruments used by his illustrious uncle, Sir Astley Cooper, when he cut for stone, presented by Mr. Edward Cock in 1872.

THE Local Government Board has issued a memorandum to tribunals, directing that special consideration should be given to the cases of the officials of local authorities (including public health, asylum, and Poor Law authorities), in view of the raising of the military age and of the increasing duties of local authorities. The efficient performance of these duties is of high importance at the present time, and a sufficient experienced staff is essential. Tribunals are directed to deal with each case on its merits, bearing in mind the standards which have now to be applied. A communication on this subject will also be sent by the Minister of National Service to National Service representatives.

AT the annual Austrian Tuberculosis Day the president, Count Larisch, stated that before the war not more than 800 beds were provided for tuberculosis in Austria. By the end of December, 1917, there were nearly 5,600 beds, apart from the beds occupied by tuberculous soldiers. There were, moreover, 450 beds for the sunlight and high-altitude treatment of surgical tuberculosis, as well as a great number of beds in the special departments of public hospitals. Formerly there were only ten dispensaries; in a few months there would be 50. The State had allocated 13½ million kronen in 1917 to this work.

A SPECIAL penal cases meeting of the Central Midwives Board was held on June 19th, Sir Francis Champneys in the chair. Of the thirteen midwives cited to appear seven were struck off the roll, one was censured, and one cautioned. Most of the charges arose out of failure to advise medical aid in cases of departure from normal conditions, such as delay in expulsion of the placenta and membranes, ophthalmia, excessive haemorrhage. One was a case of insobriety, and there were the usual charges of want of cleanliness and not taking and recording the pulse and temperature. At the ordinary monthly meeting on June 20th a communication was reported from the Acting Registrar of the General Medical Council with reference to the action of a medical practitioner who had given a certificate to an uncertified woman certifying that she was "quite capable of undertaking the duties of an ordinary midwife." It was decided that the chairman be asked to communicate with the President of the General Medical Council and to express the views of the Board. Twenty-five midwives were removed from the roll on their own application. The Secretary reported on the introduction of the Midwives Bill, 1918, into the House of Lords.

OWING to the large increase in the demand of the forces for registered dentists their position has become similar to that of medical practitioners, and a special tribunal, known as the Dental Tribunal, has been appointed to deal with the best distribution of the professional services of dentists between the military and civilian requirements. The Minister of National Service has agreed that a registered dentist shall not be called up for military service except for dental work as a commissioned officer, provided that any registered dentist who is left in civilian life is engaged in dental work which, in the opinion of the dental tribunal, is of urgent national importance. The dental tribunal contains representatives of the dental profession, and includes the members of the Dental Service Committee, who have already rendered valuable service in dealing with the cases of registered dentists. From July 1st applications on whatever grounds for the grant, renewal, or review of certificates of exemption on behalf of registered dentists will be dealt with by the Dental Tribunal, whose address is 19, Hanover Square, London, W.1. The powers, functions, and procedure of the tribunal will be the same as those of an appeal tribunal. The Local Government Board has constituted the tribunal as follows: Dr. G. S. Buchanan, C.B., chairman; Dr. N. G. Bennett, Mr. H. R. F. Brooks, Mr. G. G. Campion, Dr. W. H. Dolamore, Dr. W. J. O'Donovan, Mr. N. Bishop Harman, F.R.C.S., Mr. Walter Harrison, Mr. M. F. Hopson, Mr. W. B. Paterson, F.R.C.S., Mr. E. H. Pelham, Mr. Rees Price, Dr. C. F. Rilot, and Dr. J. Smith Whitaker.

THE result of an inquiry by the Prussian Home Minister into the merits of salvarsan is said to be very favourable. Reports on over 75,000 cases treated were given, and of the fatalities more or less traceable to salvarsan, many occurred when the drug was first introduced, and its effects were not properly understood. The incidence of deafness was 0.0026 per cent., of blindness 0.0013 per cent.

At a meeting of the London Association of Medical Women on June 4th, with Lady Barrett in the chair, Dr. Mary Scharlieb, in opening a discussion on medical etiquette, said that doctors had two main duties towards their patients—to secure adequate treatment and to avoid inflicting unnecessary distress of mind or body. Speaking more especially of venereal disease, she said that since adequate treatment was lengthy, troublesome, and expensive patients were apt to break it off too soon unless the doctor cultivated their confidence, and explained the effects of insufficient treatment. In deciding whether to give a patient the straightforward diagnosis, each case should be considered on its merits, but if the patient asked a direct question, she should be given a straight clear answer. To the question, Did my husband infect me? one could honestly reply that it was impossible to say. The husband should always be seen, and when necessary advised as to obtaining treatment. Suspected carelessness or ignorance on the part of other practitioners should never be exposed to the patient. A full report should be furnished to the doctor sending a patient, but the patient's secret should not be divulged to any one else without her permission. Where there was danger of infection the patient's permission to inform her father, husband, or employer should be sought. Cases of approaching marriage offered difficulty, for the doctor was liable to prosecution for slander if he mentioned the presence of venereal disease, and for libel if he wrote about it. The Royal Commission was in favour of making this a privileged communication. Lady Barrett thought it wrong to inform a husband that his wife had venereal disease without her full knowledge and consent, and vice versa. In cases sent by midwives to antenatal clinics, the patient's permission should be sought to inform the midwife if venereal disease existed. Care was necessary in these cases to avoid liability for slander or libel. Dr. Jane Walker pointed out that the diagnosis was the patient's own affair, and no business of relations, friends, or employers who paid the fees. Dr. Eleanor Lowry, discussing the relations between hospitals, advocated the establishment of some central place at which patients could apply for treatment, and whence they could be referred to the most suitable hospital. A list of unoccupied beds at the various hospitals could be kept there to facilitate the admission of acute cases.

Letters, Notes, and Answers.

AUTHORS desiring reprints of their articles published in the BRITISH MEDICAL JOURNAL are requested to communicate with the Office, 429, Strand, W.C.2, on receipt of proof.

The postal address of the BRITISH MEDICAL ASSOCIATION and BRITISH MEDICAL JOURNAL is 429, Strand, London, W.C.2. The telegraphic addresses are:

1. EDITOR OF THE BRITISH MEDICAL JOURNAL, *Aitiology*, Westrand, London; telephone, 2531, Gerrard.

2. FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisements, etc.), *Articulate*, Westrand, London; telephone, 2630, Gerrard.

3. MEDICAL SECRETARY, *Medisecra*, Westrand, London; telephone, 2634, Gerrard. The address of the Irish Office of the British Medical Association is 16, South Frederick Street, Dublin.

The address of the Central Medical War Committee for England and Wales is 429, Strand, London, W.C.2; that of the Reference Committee of the Royal Colleges in London is the Examination Hall, 8, Queen Square, Bloomsbury, W.C.1; and that of the Scottish Medical Service Emergency Committee is Royal College of Physicians, Edinburgh.

QUERIES AND ANSWERS.

THE acting medical officer for the county of Montgomery (Newtown, North Wales) desires to hear of a modern hospital for infectious diseases containing eighteen to twenty beds.

LETTERS, NOTES, ETC.

DIPHTHERIAL INFECTION OF WOUNDS.

DR. J. LEWIS THOMAS (Newport, Mon.) writes: The paragraph on page 676 recalls a clinical lecture by the late Mr. Lockwood of St. Bartholomew's, in which he describes an incised mammary abscess which would not heal. It was noticed that a child in a cot alongside the woman's bed had a chronic nasal catarrh, and a swab was taken and found to carry *B. diphtheriae*. Injection of antitoxin was very quickly followed by healing of the chronic wound.

MEDICAL SICKNESS AND ACCIDENT SOCIETY.

A COUNTRY MEMBER writes: In the JOURNAL of June 1st I was glad to see another letter of protest by "An Old Member" against the arbitrary action of the committee of the above society nullifying their own previous statements and promises and thereby causing, after this year, a serious monetary loss

to old members who had trusted them—as it now appears—in vain. It is to be hoped some energetic member living in or near London will give his name and address so that all who are dissatisfied may send their names and addresses and arrange for a private meeting to discuss the best method of getting this unfair resolution rescinded. A list of members is published by the society.

ONE OF THE OLDEST MEMBERS writes: As another very old member of the Medical Sickness and Accident Society, may I add my protest against the action which the society proposes to take with regard to the bonus? Let the society make any terms it likes with new members, but it is certainly, to put it mildly, a breach of faith and scarcely honest to attempt to deprive the members of many years' standing of their expected and promised bonus. For over thirty years I have done all in my power to persuade my brother practitioners to join the society, but if this unfair action is allowed to pass I shall most certainly in future do all I can to dissuade them.

THE CHIEFTAINSHIP OF THE CLAN FARQUHARSON.

A CORRESPONDENT writes: Dr. Farquharson regarded himself and was generally recognized as the chieftain of his clan. In his volume of reminiscences, *In and Out of Parliament*, he tells of a visit to Sir Henry Campbell-Bannerman at Belmont Castle in Perthshire, in December, 1897, at which a feature of the entertainment was "some vigorous reels." This was celebrated in verse by Sir Charles Cameron, M.P., who sang:

Miss Ruxton down in Italy had oever seen a kilt,
So Finzean's laird, The Farquharson, has braced himself to till't,
And he shows with sporrnan whisking and skean-dhu on knee
How a Highland Chief can foot it 'fore a jolly G.C.B.

I remember some years ago at a time of political crisis, when "retaliation" dinners were raging, being present at a dinner in aid of Epsom College. Lord Rosebery, who was in the chair, humorously referred to the difficulty in which he was placed by the presence of some prominent politicians, among whom he specially named the chieftain of the powerful clan Farquharson. Speaking of this afterwards to Dr. Farquharson, I ventured to hint that I was under the impression that his kinsman of Invercauld was the chief of the clan. With the nervous cough that so often prefaced his utterances, and every hair in his moustache bristling with defiance, the laird of Finzean replied: "Invercauld! Why he doesn't even claim it."

A FUNGUS FLY AND COCKROACH KILLER.

It has long been known, at least in Germany, where it goes by the name of "Fliegenpilz" or "Fliegenschwamm," that the fungus *Amanita muscaria* has insecticide properties, but they seem seldom to have been turned to account. Dr. E. Wildbrand, however, states that in the government of Minsk it is extensively used by the native population. Placed stalk uppermost it is baked for two or three minutes to set free the poisonous juices. The stalk is then broken off and the lamellae strewn with castor sugar, which dissolves in the juice. The bait is put out of reach of any domestic animal, and should not be left near food or kept in a room where cooking is going on. The poison, however, acts so rapidly that the dying fly does not creep far. When the juice has evaporated the sugar ceases to be poisonous, but the toxicity of the bait can be maintained for a few days by adding a little water occasionally. It is also said that if spread out on a large plate the sugary juice kills cockroaches as well as flies.

THE BELGIAN DOCTORS' AND PHARMACISTS' RELIEF FUND. Subscriptions to the Second Appeal.

The following subscriptions and donations to the Fund have been received during the week ending June 22nd:

	£	s.	d.		£	s.	d.
Dr. James Craig ...	2	2	0	Mrs. de Meray* ...	0	5	0
Dr. C. C. Easterbrook ...	1	0	0	Dr. T. M. Cuthbert ...	1	1	0
Dr. Thomas Guthrie ...	2	2	0	Dr. W. A. Bond ...	2	2	0
Mr. Percy Hoar* ...	200	0	0	Anonymous... ..	0	17	6
Mrs. Harrison* ...	5	0	0				

* Per Dr. Des Vœux.

† Per Sir Rickman Godlee.

Subscriptions to the Fund should be sent to the Treasurer, Dr. H. A. Des Vœux, at 14, Buckingham Gate, London, S.W.1, and should be made payable to the Belgian Doctors' and Pharmacists' Relief Fund, crossed Lloyds Bank, Limited.

SCALE OF CHARGES FOR ADVERTISEMENTS IN THE BRITISH MEDICAL JOURNAL.

	£	s.	d.
Seven lines and under ...	0	6	0
Each additional line ...	0	0	9
Whole single column ...	4	0	0
Whole page ...	12	0	0

An average line contains six words.

All remittances by Post Office Orders must be made payable to the British Medical Association at the General Post Office, London. No responsibility will be accepted for any such remittance not so safeguarded.

Advertisements should be delivered, addressed to the Manager, 429, Strand, London, not later than the first post on Wednesday morning preceding publication, and, if not paid for at the time, should be accompanied by a reference.

NOTE.—It is against the rules of the Post Office to receive *poste restante* letters addressed either in initials or numbers.

THE MEDICAL NEEDS OF THE SERVICES.

ACTION BY THE NATIONAL SERVICE MINISTRY.

MEDICAL MEN OF MILITARY AGE.

WE are informed by the Ministry of National Service that the following circular letters have been issued to the medical practitioners concerned. With regard to the second letter, asking medical men of military age to present themselves for physical examination, it is desirable to point out that recipients of the letter need be under no apprehension in this matter. It is, as stated, *not* a calling up notice, nor will it be even a remote preliminary to calling up, except in the cases of medical men who in any circumstances would be under the consideration of the Central Professional Committees with a view to possible service in the Royal Army Medical Corps.

Ministry of National Service,
Westminster, S.W.1.
December, 1917.

Sir,

I am directed to inform you that, with a view to maintaining the required number of officers in the Royal Army Medical Corps consistently with the least disorganization of medical service throughout the country, it is necessary to call upon all medical practitioners of military age who have resigned, or may resign, their temporary commissions on the expiry of an annual contract on and after October 31st, 1917, to resume their commissions.

This decision has not been arrived at without a very full consideration of the medical needs of the civilian population on the one hand and of the urgent requirements of the army on the other, as well as of the services which such officers have already rendered. This proposal will not affect the customary privilege which has hitherto been accorded to the profession, of laying any difficulties, which individual practitioners may have in accepting or resuming service, before a Committee of their professional colleagues.

The Minister of National Service therefore urgently requests that you will immediately place yourself in the hands of the appropriate Central Professional Committee in order that within the next fourteen days the Professional Committee may be put in possession of the facts, which will enable it to determine whether your services may again be placed at the disposal of His Majesty's Government.

I am, Sir, your obedient Servant,
E. A. SANDFORD FAWCETT,
Secretary.

* The following are the addresses of the Central Professional Committees:

The Central Medical War Committee, 429, Strand, London, W.C.2, for all enrolled practitioners in England and Wales,
The Committee of Reference, 8 to 11, Queen Square, London, W.C.1, for practitioners on the staffs of all hospitals in the London area.
The Scottish Medical Service Emergency Committee, 9, Queen Street, Edinburgh, for practitioners in Scotland

Ministry of National Service,
Westminster, S.W.1.
December, 1917.

Sir,

In connexion with the general survey of the man-power resources of the nation, the Minister of National Service requires to have an index, brought up to date, of the physical fitness of all medical practitioners throughout the country who are of military age, irrespective of whether they have or have not already served in the Royal Army Medical Corps.

You are therefore requested, notwithstanding any previous examination, to present yourself for medical examination by a National Service Medical Board at , between the hours of and , on or before the 12th January, 1918.

If your ordinary residence is more than five miles distant from the place of examination, your railway fare will be paid by the Ministry of National Service on application to the Deputy Commissioner of Medical Services.

Please take this notice with you as a warrant for your examination.

Kindly observe that this is not a "calling up" notice, but a request that you will assist the organization of the National Service by submitting yourself for medical examination on or before the above-mentioned date.

Special arrangements are being made in each area for the examination of medical men, which will be communicated to you by the Deputy Commissioner of Medical Services in your area.

I am, Sir, your obedient Servant,
E. A. SANDFORD FAWCETT,
Secretary.

MEDICAL STUDENTS.

The Ministry of National Service is now in touch with the deans of the medical schools throughout the country on the whole question of military service as it affects medical students, and we understand that a conference was held recently at the Ministry, which was attended by more than thirty deans. Several of those present gave it as their opinion that the situation with regard to the possible shortage of medical students was not so urgent as the public has been led to suppose from desultory unofficial paragraphs in the lay press. The difficulties and complexities of the problem were fully realized, and certain recommendations were made, which, we learn, are being acted upon by the Ministry.

The large demands by the Admiralty for the services of students as surgeon probationers in the navy for a period of six months were discussed at the conference. It is probable that in future every physically fit male student will be expected to give this or some similar service during his course of professional study. By arrangement with the licensing bodies, such service will not delay qualification, and the need for it is so urgent that the Ministry of National Service cannot fail to meet it as fully as possible.

Meetings of Branches and Divisions.

SHROPSHIRE AND MID-WALES BRANCH.

The following resolutions were carried unanimously at the meeting of the Branch on December 18th, 1917, and have been forwarded to the Salop County Council:

- (1) In the opinion of the Shropshire and Mid-Wales Branch of the British Medical Association it is desirable that a pathological and research laboratory should be established by the public authorities for the benefit of the county of Salop; that it should be equipped for all microscopical, analytical, and pathological work, and that it should have an efficient staff, part of whose duties it should be to undertake research work. It is suggested that such an institution would be valuable not only for work connected with medicine, public health, and veterinary surgery, but, in addition, might undertake research work in agricultural matters.
- (2) In cases of midwifery attended by midwives under the control of the County Council, the Shropshire and Mid-Wales Branch of the British Medical Association is of opinion that an arrangement should exist for the payment of a fee of £2 2s. to medical men called in to the assistance of the midwives.

SUSSEX BRANCH: HORSHAM DIVISION.

A MEETING, with Mr. Mark Vernon in the chair, was held at Horsham on December 21st, 1917. All medical men practising in the area were invited to attend, and the meeting was representative of the whole area.

After consideration of information furnished by the Medical Secretary as to action taken by other areas, it was unanimously resolved that:

At the present time, when the cost of living is so greatly increased and the price of all drugs and appliances is so much higher, it is right and proper that the charges made for medical and surgical attendance and medicines ought to be higher than those made previous to the war, and that such increase should be an amount not exceeding 25 per cent.

The scale of payment recommended in the British Medical Association letter for treatment of disabled sailors and soldiers in voluntary hospitals was approved.

The CHAIRMAN put before the meeting the claims of the British Medical Association as the best and most efficient body to represent the interests of the profession, and appealed to non-members to join the Association and strengthen it in its efforts.

MOTOR CAR BADGE FOR MEMBERS OF THE ASSOCIATION.

THE motor car badge referred to on page 101 of the SUPPLEMENT of November 24th, 1917, is now ready for issue to members of the Association, and may be obtained at the cost of 1s. on application to the Financial Secretary and Business Manager, 429, Strand, London, W.C.2. The badge is intended to be affixed by gum or paste to the inner surface of the wind screen. The badge will only be issued on the distinct understanding that the member to whom it is supplied will only use it when his car is engaged on professional or other purposes expressly authorized in the Motor Spirit Restriction Order No. 2 of 1917, and that the Association does not accept any responsibility for any improper use that may be made of the badge.

THE ORGANIZATION OF THE PROFESSION.

WE have received the following communication from Dr. R. H. Botham (Skelton-in-Cleveland) in reply to the letter from the Medical Secretary printed in the SUPPLEMENT of December 22nd, 1917 (p. 124):

Sir,—

As a member of the North Riding Panel Committee, I should like to be allowed to reply to the letter of Dr. Alfred Cox in which he accuses us of violating the fundamental principles of democratic government.

Of course if Dr. Cox is to be allowed to define these principles, and to apply them as he pleases, he should have no difficulty in proving his case. He takes it for granted that the Insurance Committee of the British Medical

Association is a thoroughly democratic representative of the panel practitioner. Our view is that it is a friendly committee which assisted at the birth of the panel doctor, tended him in his infancy, and now that he is come of age must be prepared to surrender its guardianship.

The proper representatives of the panel practitioners are the Panel Committees, and the proper representative of the Panel Committee is a general committee, the members of which have been elected by the Panel Committees. There is as yet no such general committee in existence, but it is "on the way."

In the meantime, while we are still in tutelage, our Panel Committee can only undertake to accept the ruling of the British Medical Association Insurance Committee when it has been, at least, consulted. This did not happen when the scheme for the treatment of invalid soldiers was under discussion; in fact, I am told that the whole negotiations were conducted by two gentlemen without even the knowledge of the Insurance Committee of the British Medical Association.

I am, etc.,

R. H. BOTHAM.

INSURANCE.

THE NATIONAL ASSOCIATION OF INSURANCE COMMITTEES.

THE Executive Council of the National Association of Insurance Committees has sent to all Insurance Committees copies of resolutions which it has passed, urging that steps should be taken to secure that every Local War Pensions Committee contains representatives of the Insurance Committee of the area; that the best means of obtaining this would be by an amendment in the bill now before Parliament giving Insurance Committees a statutory right to such representation; but if such an amendment be not inserted, the Council asks the Minister of Pensions to recommend local authorities to make provision in any amended scheme for the appointment of representatives on the nomination of local Insurance Committees. On this question a deputation waited on the Minister of Pensions, who replied that he had come to the conclusion that many difficulties would arise if it were dealt with in the amending bill as other bodies might also claim representation, and as a corollary the Pensions Committees might also claim a right to representation on Insurance Committees. He would, however, favourably consider any amended schemes submitted for the constitution of Local Pensions Committees, tending to promote their efficiency.

Discharged Tuberculous Soldiers.—The Council some time ago suggested to the Insurance Commissioners that the Orders of the Army Council should be so amended as to permit soldiers suffering from tuberculosis to be retained under military discipline and control while in receipt of sanatorium treatment granted by an Insurance Committee. The Commissioners, while holding out no hope that this suggestion would be adopted by the Army Council, stated that it had been arranged that men discharged from the services with tuberculosis might be granted a short furlough in suitable cases prior to their admission to civil institutions, and the Commissioners anticipate that this arrangement might to a large extent remove the conditions which have hitherto contributed to the refusal of soldiers to accept sanatorium treatment.

A Ministry of Health.—The Council resolved that, while strongly in favour of legislation to reduce child mortality, such legislation should be initiated under a Ministry of Health and not in a prior and separate bill. On this matter it will be seen that the Council is in close agreement with the views expressed in the letter sent to the Cabinet on November 30th by the British Medical Association, and similar views have been expressed in a letter sent to the Prime Minister by the National Union of Women Workers. When this subject came before the Salford Insurance Committee, Dr. J. H. Taylor suggested that it was eminently desirable to obtain, if possible, some concerted action between the National Association of Insurance Committees and the British Medical Association as the two bodies agreed in many respects in their views as to a Ministry of Health. The chairman of the Insurance Committee, Alderman Huddart, who is this year Mayor of Salford and is a member of the Executive Council of the Association of Insurance Committees, promised that

the question of co-operation should be considered by the Council. The Council was also of opinion that Insurance Committees, as they have to deal with maternity benefit, ought to have a statutory right to representation on all local public health committees dealing with maternity and child welfare, especially in view of what follows in the next paragraph.

Medical Benefit for Dependents.—A further important decision was reached by the Executive Council—namely, that it should press for the immediate provision of medical benefit for the widows and orphans of soldiers and sailors and also for the early provision through Insurance Committees of medical benefit for the dependants of insured persons. This resolution appears to have the support of a large majority of Insurance Committees.

LOCAL MEDICAL AND PANEL COMMITTEES.

Surrey Panel Committee.—In a recent circular to panel practitioners, issued by the Surrey Panel Committee, it is pointed out that although the Panel Medico-Political Union, through its representatives at the recent conference, declared itself as acting in no spirit of hostility to the British Medical Association and desirous of acting in unison with it, it is impossible to reconcile this attitude with their recent issue of a circular dated November 17th, 1917, asking panel practitioners to refuse treatment to discharged soldiers and sailors under the British Medical Association scheme, which a representative conference had accepted by an overwhelming majority. The circular states that such action can only be stigmatized as disloyal to the Conference of Panel Committees at which the policy was adopted.

Gloucestershire.—At a recent meeting of the Gloucestershire Local Medical and Panel Committee it was agreed to send a subscription of 10 guineas towards the expenses of the Insurance Acts Committee in connexion with the special inquiry into the central pool. A proposal to join the Association of Panel Committees was defeated. The scheme for collective bargaining, as set out in document M. 18 of the Insurance Acts Committee, was agreed to. It was resolved to circularize all the practitioners on the panel with regard to the new regulations respecting the treatment of discharged disabled soldiers and sailors, but it was considered that in the present circumstances the statistics of illness amongst these men would be faulty and quite unreliable.

Nottingham and Nottinghamshire.—At a joint meeting of the Nottingham and Nottinghamshire Local Medical and Panel Committees on November 27th, 1917, to which all panel practitioners in the city and county were invited, it was resolved that all prescriptions ordered from a local formulary or otherwise containing a deleted pharmacopoeial preparation will be interpreted in the absence of evidence of contrary intention on the part of the prescriber, as indicating the equivalent for the deleted preparation contained in the addendum (War Emergency Formulae) of the B.P.C.

It was resolved that those present pledge themselves loyally to support the Insurance Acts Committee of the British Medical Association, should it be found necessary to carry into effect the scheme for collective bargaining submitted by the Insurance Acts Committee to and approved by the 1917 Conference.

Glasgow Burgh.—At a joint meeting of the Local Medical and Panel Committees on December 13th, 1917, the Secretary was instructed to submit to the Insurance Committee an estimate of the administrative expenses of the Panel Committee for 1918 on the same lines as in current year, including one-third of Glasgow's share of the cost of the Central Checking Bureau, and including a sum for clerical expenses not exceeding £50. It was resolved to recommend to the Insurance Committee that no change be made in the list of Emergency Drugs and Appliances for 1918.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty:—**Fleet Surgeons:** E. T. Burton to the *Indomitable*; R. S. Osborne to the *Pembroke*, additional, for disposal; P. F. Alderson to the *Africa*. **Staff Surgeons:** J. C. F. D. Vaughan to the *Forth*; D. P. Chapman to the *Thames*; W. H. Edgar, M.D., to the *Talbot*. **Surgeon E. St. G. S. Goodwin, M.B., to Gibraltar Hospital.** **Temporary Surgeons:** A. T. Woodward, M.B., to the *Suipie*; P. Macarthur to the *Woodcock*; B. Burnside to Chatham Hospital; J. D. Dimock and T. F. Reason to Plymouth Hospital; P. Ward to Haslar Hospital; R. St. A. Heathcote, M.B., to the *Fandicture*; H. R. Buttery to the *Hyacinth* for Zanzibar (shore); D. L. Lewis to the *Pembroke*, additional, for medical transport duties (ambulance train); G. R. Lynch, M.B., to R.N. Depot, Crystal Palace. To be temporary Surgeons: W. G. Gover, M.B., C. H. Laver.

ROYAL NAVAL VOLUNTEER RESERVE.

To be Staff Surgeon: T. D. Luke, M.D. To be Surgeon Probationers: W. H. Smorfitz, W. L. Kennedy.

ARMY MEDICAL SERVICE.

The undermentioned are placed on retired pay on having attained the age limit:—**Surgeon-Generals:** H. R. Whitehead, K.C.B., F.R.C.S., J. G. MacNeece, C.B., T. M. Corker, C.B., M.D., Sir D. Bruce, C.B., F.R.S., M.B., Sir R. W. Ford, K.C.M.G., C.B., D.S.O., Sir T. P. Woodhouse, K.C.M.G., C.B., R. H. S. Sawyer, C.M.G., M.B., Colonels (temporary Surgeon-Generals, and are granted the honorary rank of Surgeon-General): J. M. Irwin, C.B., M.B., B. M. Skinner, C.M.G., M.V.O., J. Maher, C.B., G. D. Hunter, C.B., C.M.G., D.S.O., R. S. F. Henderson, C.B., M.B., M. W. Russell, C.B., S. Hickson, C.B., M.B., Colonels: H. J. Barratt, H. O. Trevor, C. E. Nichol, C.M.G., D.S.O., M.B., S. Westcott, C.B., C.M.G., R. Kirkpatrick, C.B., C.M.G., M.D., E. H. L. Lynden Bell, C.B., M.B., R. H. Firth, F.R.C.S., E. A. Tate, C.M.G., C. E. Faunce, R. J. Gendes, C.B., D.S.O., M.B., H. M. Sloggett, C. Birt, S. C. Philson, J. H. Daly, M. J. Sexton, C.B., M.D., H. E. Cree, R. J. Widdle, M.B., W. H. Horrocks, C.B., M.B., E. A. Burnside, C. R. Elliott, M.D., J. W. Bullen, M.D., R. Caldwell, F.R.C.S., C. A. Lane, M.B.

To be Surgeon-Generals: Colonels (temporary Surgeon-Generals) H. N. Thompson, C.M.G., D.S.O., M.D., A. A. Sutton, C.B., D.S.O., M. T. Yarr, K.C.M.G., C.B., F.R.C.S., C. H. Burchall, C.B., C.M.G., M.B., Colonels: W. T. Swan, C.B., M.D., G. Cree, C.B., C.M.G., H. Carr, C.B., M.D.

Lieut.-Colonels from R.A.M.C. to be Colonels: Brevet Colonels O. L. Robinson, C.M.G., K.H.P., E. M. P. J.cher, D.S.O., M.B., F.R.C.S., W. G. Bexys, D. J. Collins, M.D., G. T. K. Maurice, C.M.G.; Lieut.-Colonels G. S. McLoughlin, C.M.G., D.S.O., M.B., W. W. O. Beveridge, C.B., D.S.O., M.B., H. J. M. Baile, D.S.O., M.B., G. B. Armstrong, C.M.G., M.B., F. W. Peggie, H. A. Hinge, C.M.G., H. A. Bray, C.M.G., E. W. Slaxter, C.M.G., H. S. Thurston, C.M.G., T. P. Jones, C.M.G., M.B., G. A. Moore, C.M.G., M.D., E. H. Condon, M.B., C. E. Pollock, D.S.O., F. R. Buswell, C.M.G., T. H. J. C. Goodwin, C.M.G., D.S.O., A. E. C. Keble, D.S.O., J. R. MacMunn, C.M.G., H. V. Prynce, D.S.O., F.R.C.S., G. D. Browning, S. F. St. D. Green, M.D., P. Evans, C.M.G., M.B., C. K. Morgan, C.M.G., M.B., G. St. C. Thom, C.M.G., M.B., G. W. Profeit, D.S.O., M.B., F. Kiddo, C.M.G., M.B., R. J. Blackham, C.B., D.S.O., H. W. Grattan, J. V. Forrest, C.M.G., M.B., J. C. B. Statham, C.M.G., E. T. F. Birrell, C.B., C.M.G., M.B., E. W. Bliss, D.S.O., A. H. Morris, R. W. Clements, D.S.O., M.B., W. E. Hudleston, D.S.O.

Temporary Lieut.-Colonel W. N. Barron, C.M.G., M.V.O., from R.A.M.C. to be temporary Colonel.

ROYAL ARMY MEDICAL CORPS.

Lieut. Colonels placed on retired pay on having attained the age limit: T. B. Winter, A. T. I. Lily, H. J. Fletcher, M.B., M. O'Halloran, M.B., W. E. Berryman, A. E. Morris, M.D., C. T. Blackwell, M.D., H. H. Brown, R. Holyoake, H. E. Winter, (Brevet Colonel) F. Smith, C.M.G., D.S.O.

Temporary Major C. C. Choyce, M.D., F.R.C.S., to be temporary Lieut.-Colonel.

Major L. L. G. Thorpe is placed temporarily on the half-pay list on account of ill health.

A. G. W. Bowen, M.B., Fleet Surgeon R.N. (ret.), to be temporary Major.

J. McC. Martin, D.S.O., late temporary Major, is granted the honorary rank of Major.

Temporary Captain W. B. Cosens to be temporary Major whilst specially employed.

The notification in the *London Gazette* of November 14th, 1917, regarding temporary Captain J. A. Smith, M.C., M.B. is cancelled.

A. D. Claunch, late temporary Captain, is granted the honorary rank of Captain.

Temporary Captain J. H. Wilson relinquishes his commission on account of ill health contracted on active service.

Temporary Captain M. Chadwick relinquishes his commission on account of ill health, and is granted the honorary rank of Captain.

Temporary Captains relinquish their commissions: A. Burton, M.D., F.R.C.S., J. M. N. Paton, M.B., E. F. Reeve, M.B., C. C. B. Thompson, C. Fraser, M.D., A. Montgomery, M.B., L. T. Dean, M.B., J. G. Copland, M.B., E. C. Moore, M.B., F.R.C.S.E., R. N. Watson, H. Smith, E. McIntyre, R. B. Hennessy, M.B., A. Whyte, M.D., W. S. Williamson, L. Levy, M.B., W. D. G. Mulloy, M.B., J. Craig, M.B., S. Infield, and is granted the honorary rank of Captain: A. McI. Cato, H. W. Teague, M.B., C. O. Jones, M.D., W. E. Hills, R. H. Shephard, J. B. Milne, M.B., T. D. Kennedy, J. L. Aymard.

To be temporary Captains: F. A. R. Hacker, A. R. Hall, M.D., J. T. Kirkland, M.C., M.B.

Temporary Lieutenants to be temporary Captains: P. B. Brown, H. Findlay, M.B., C. E. H. Paley, J. C. G. Bacon, S. W. Fisk, D. Cozan, W. D. Thomson, M.D., R. C. Rogers, M.B., D. Finlayson, M.B., H. W. Bernard, M.B., T. M. Thomson, T. R. Robertson, M.B., H. A. Grierson, M.B., A. E. Hart, M.B., A. Newton-Brady, M.B., G. H. Adam, J. K. Watson, M.D., C. D. H. Corbett, M.D., A. G. Macdonald, M.D., F. Challans, M.D., C. E. Tangye, M.D., M. E. A. Wallis, I. G. Cobb, H. Freeth, M.D., J. H. Kay, M.B., D. F. Borrie, H. O'H. H. May, P. Steele.

Temporary Lieutenants relinquish their commissions: T. S. Robson, H. D. Wilson, M.B., T. P. Campbell, M.B., H. C. Schockett, M.B., W. P. Morgan, M.B., M. H. Bland, M.D., W. Daunt, J. A. Berlyn, M.B., J. M. Smith, C. Watson, C. R. Brown, H. H. Moyle.

Temporary Lieutenant C. P. Crouch relinquishes his commission on account of ill health and is granted the honorary rank of Lieutenant.

Temporary Lieutenant J. J. W. Evans, F.R.C.S., relinquishes his commission on account of ill health contracted on active service.
To be temporary Lieutenants: J. W. O. van Milligan, M.B., W. J. McNab, M.B., H. M. Berry, M.D., J. L. Schilling, T. A. Fall, A. Robin, M.D., R. H. Vercoe, H. M. Birkett, C. A. A. Lever, S. Johnson, M.D., J. B. Munford, L. W. Huellin, H. Gibson, C. Clyne, M.B., F. G. F. Browne, M.B., S. Nix, M.D., T. J. Cobbe, M.B., F.R.C.S., P. Savill, M.D., D. Holroyde, M.B.

OVERSEAS CONTINGENTS.

CANADIAN ARMY MEDICAL CORPS.

Lieut.-Colonels (acting Colonels) to be temporary Colonels: A. Primrose, O. A. Peters, R. P. Wright, E. C. Hart, C.M.G., F. Etherington, C.M.G.

Temporary Lieut.-Colonels to be temporary Colonels: S. H. McKee, G. D. Farmer, W. Webster, D.S.O., W. B. Hendry, D.S.O., J. T. Clarke, E. G. Davis, C.M.G.

Temporary Majors (acting Lieut.-Colonels) to be temporary Lieut.-Colonels: E. L. Stone, J. C. Meakins, J. A. Amyot, R. S. Pentecost, T. A. Starkey, F. C. Bell, L. E. W. Irving, D.S.O., D. A. Whitton, H. E. Kendall, D. P. Kappela, J. N. Gunn, G. H. Reason, G. J. Boyce, A. T. Bazin, A. L. C. Gilday, P. G. Bell, J. J. Fraser.

Temporary Majors to be temporary Lieut.-Colonels: L. R. Murray, P. Bennett, D.S.O., H. C. Parsons, L. C. Harris, C. E. C. Cole, S. Campbell.

Temporary Captains to be temporary Majors: W. J. McAlister, M.C., C. McMane, T. Lyon, A. F. Macanlay, H. E. Ridgewood, J. H. Leeming, D. W. McKechnie, C. Cartwright, R. Y. Kenny.

Temporary Captain T. L. Harrison is seconded for duty with the War Office.

Temporary honorary Captains resign their commissions: E. K. Clarke, F. F. Tisdall.

TERRITORIAL FORCE.

ARMY MEDICAL SERVICE.

Colonels placed on the Territorial Force Reserve: S. S. Hoyland, M.D., E. C. Freeman, C.M.G., M.D., J. V. W. Rutherford, C.B., de B. Birch, C.B., M.D., H. J. Mackay, M.D., C. E. Harrison, C.M.G., M.V.O., M.B.

Lieut.-Colonels from R.A.M.C.T.F. to be Colonels: A. W. Sheen, M.D., W. Ranson, D.S.O., F.R.C.S., H. E. B. Bruce-Porter, C.M.G., (Brevet Colonel) A. M. Connell, F.R.C.S.E., A. D. Sharp, C.M.G., F.R.C.S., E. J. R. Evatt, M.B.

ROYAL ARMY MEDICAL CORPS.

G. G. Little, late temporary Captain, R.A.M.C., to be Captain for service with the Senior Division O.T.C.
Corporal I. Walker from R.E. to be Lieutenant.

TERRITORIAL FORCE RESERVE.

Captains R. S. Young, M.B., and L. W. Hignett, M.B., from R.A.M.C., to be Captains.

MINISTRY OF NATIONAL SERVICE.

The following relinquish their commissions on appointment to the Ministry of National Service: Lieut.-Colonel (Brigade Surgeon Lieut.-Colonel) W. J. Fleetwood (T.F.R.). Temporary Captains S. J. Cullum, H. H. Folker, D. J. G. Johnston, M.B., R. A. Jones, and N. Smith, R.A.M.C.

EXCHANGES.

M.O. attached Northern Command would like to exchange with M.O. attached London Command.—Address, No. 4349, BRITISH MEDICAL JOURNAL Office, 429, Strand, W.C.2.

M.O. attached Southern Command would like to exchange with M.O. Irish Command, preferably Dublin or the South.—Address, No. 100, BRITISH MEDICAL JOURNAL Office, No. 429, Strand, W.C.2.

Medical officer serving in the Northern Command would like to exchange with one serving in the London Command.—Address, No. 4200, BRITISH MEDICAL JOURNAL Office, No. 429, Strand, W.C.2.

VACANCIES.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice (see Index to Advertisements—Important Notice re Appointments) appearing in our advertisement columns, giving particulars of vacancies as to which inquiries should be made before application.

ALNWICK INFIRMARY.—House-Surgeon.

AUSTRALIAN COMMONWEALTH: SERUM LABORATORIES.—(1) Biochemist. (2) Two Senior Bacteriological Technical Assistants. (3) Three Bacteriological Technical Assistants. Salary for (1), £450, increasing to £500; (2) £336, increasing to £408; and (3) £216, increasing to £312.

BIRKENHEAD BOROUGH HOSPITAL.—Junior House-Surgeon. Salary, £170.

BIRMINGHAM CITY.—Lady Doctor for Infant Welfare Work.—Salary, £350 per annum, increasing to £450.

BIRMINGHAM EDUCATION COMMITTEE.—Temporary Assistant School Medical Officer. Salary, £300 per annum and £5 travelling expenses.

BLACKPOOL: VICTORIA HOSPITAL.—Lady House-Surgeon. Salary, £250 per annum.

BOURNEMOUTH: ROYAL VICTORIA AND WEST HANTS HOSPITAL.—Resident House-Surgeon. Salary, £350 per annum.

BRISTOL ROYAL INFIRMARY.—(1) House-Physician; (2) House-Surgeon. Salary, £120 per annum.

CARNARVONSHIRE EDUCATION COMMITTEE.—Assistant School Medical Officer. Salary, £400 per annum.

HOSPITAL FOR SICK CHILDREN, Great Ormond Street, W.C.—Two House-Surgeons. Salary at the rate of £100 per annum and £5 washing allowance.

HULL: ROYAL INFIRMARY.—Senior House-Surgeon. Salary, £250 per annum.

INVERANON PARISH, Banffshire.—Medical Officer. Salary, £75 per annum.

LEAMINGTON SPA: WARNEFORD, LEAMINGTON, AND SOUTH WARWICKSHIRE GENERAL HOSPITAL.—Resident Medical Officer. Salary, £200 per annum.

LONDON HOMOEOPATHIC HOSPITAL, Great Ormond Street, W.C.—Two Resident Medical Officers. Salary, £100 per annum.

LIVERPOOL: DAVID LEWIS NORTHERN HOSPITAL.—House-Surgeon (male). Salary, £150 per annum.

MANCHESTER CITY.—(1) Locumtenant Second Assistant Medical Officer to the Baguley Sanatorium for Tuberculosis. (2) Temporary Assistant Tuberculosis Officer for the City. Salary, £400 and £450 per annum respectively.

ROYAL FREE HOSPITAL, Gray's Inn Road, W.C.—Two House-Physicians.

ST. PANCRAS PARISH.—Assistant Medical Superintendent of the South Infirmary. Salary, £300 per annum.

STAFFORDSHIRE, WOLVERHAMPTON AND DUDLEY JOINT COMMITTEE FOR TUBERCULOSIS.—Two Senior and two Assistant Tuberculosis Officers. Salary for senior officers £500 and £350 for assistant officers.

STOKE-ON-TRENT COUNTY BOROUGH.—Assistant Lady Medical Officer. Salary, £350 per annum.

VICTORIA HOSPITAL FOR SICK CHILDREN, Tite Street, S.W.—House-Surgeon. Salary, £200 per annum.

YORK COUNTY HOSPITAL.—House-Physician (lady). Salary, £200 per annum.

CERTIFYING FACTORY SURGEONS.—The Chief Inspector of Factories announces the following vacant appointments: Penarth (Glamorgan), Tavistock (Devon).

MEDICAL REFEREE.—Medical Referee under the Workmen's Compensation Act, 1906, for County Court Circuit No. 58 and to be specially attached to the Plymouth, Kingsbridge and Totnes, and Paignton County Courts. Applications to the Private Secretary, Home Office, by January 18th.

To ensure notice in this column—which is compiled from our advertisement columns, where full particulars will be found—it is necessary that advertisements should be received not later than the first post on Wednesday morning. Persons interested should refer also to the Index to Advertisements which follows the Table of Contents in the JOURNAL.

APPOINTMENTS.

EDINBURGH ROYAL INFIRMARY.—The following appointments have been made:—Resident Physicians: J. A. A. Duncan, to Dr. Rainy. Resident Surgeons: A. V. T. Muir, to Mr. Hodsdon; Lewis N. Nott, to Mr. Chiene; Harry M. Jacobs, to Dr. A. H. F. Barbour. Clinical Assistants: George Buchanan, to Dr. Rainy; Miss G. A. A. Boyd, to Dr. J. V. Paterson.

MECHAN, Arthur, M.B., C.M., Medical Referee in Glasgow under the Ministry of Pensions.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 6s., which sum should be forwarded with the notice not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

BIRTH.

JACKSON.—On December 27th, 1917, to Dr. and Mrs. D. J. Jackson, 62, Thornshead Road, London, S.E.—a son.

MARRIAGES.

GRIFFITH—RUCK.—On December 6th, 1917, at the Parish Church, Corris, Merioneth, by the Rev. D. Thomas, Vicar, Major Alexander Hill Griffith, R.A.M.C.(T.), of 17, St. John Street, Manchester, to Mary Ursula, second daughter of Lieut.-Colonel A. A. Ruck, late The King's Regiment, and Mrs. Ruck, Esgair, Pantperthog, Merioneth.

SHARRARD—WELLS.—On December 22nd, 1917, at All Saints' Church, Gloucester, by the Rev. A. Chastel de Boinville, M.A., W. Sharrard, M.B., Captain R.A.M.C.(T.), of Sheffield, to Winifred H. Wells, M.B., M.R.C.S., only daughter of Mr. and Mrs. A. J. Wells, Gloucester.

DEATHS.

BLYTHMAN.—On December 29th, 1917, at Swinton, near Rotherham, Yorks, Clement Samuel Blythman, M.B., C.M. Edin., M.R.C.S. Eng., in his 75th year.

BURMAN.—At 12, Bondgate Without, Alnwick, on December 26th, 1917, aged 63 years, Charles Clark Burman, L.R.C.P. and S. Edin., dearly beloved husband of Isabella Mande Burman.

DIARY FOR THE WEEK.

ROYAL SOCIETY OF MEDICINE.—Section of Psychiatry: Tuesday, 4.30 p.m., Major F. W. Mott, F.R.S.: Psychology of Soldiers' Dreams. Section of Epidemiology: Friday, 5.30 p.m., Sir Filippo de Filippi: The Italian Medical War Services.

FRIDAY.

WEST LONDON MEDICO-CHIRURGICAL SOCIETY, West London Hospital, W.—8 p.m., Cases. 8.30 p.m., Presentation of the West London Medal to Major H. E. Priestley, C.M.G., R.A.M.C. 9 p.m., Clinical Meeting.

CURRENT NOTES.

Increase of Mileage Grant for Insurance Practice.

The Rural Practitioners Subcommittee of the Insurance Acts Committee met representatives of the National Insurance Commissioners on January 3rd and discussed the method of distribution of the new grant made by the Treasury for the purpose of increasing the rate paid for mileage to rural practitioners. The Commissioners hope to make an early announcement of their intentions.

Payment of Medical Men called in by Midwives.

The Midwives Act, 1902, and the rules made thereunder by the Central Midwives Board provided that in certain circumstances a midwife must call in a medical practitioner, but no provision was made for the payment of the doctor's fee. In February, 1908, the Local Government Board issued a circular providing for the payment by boards of guardians of any medical man so called in. The Annual Representative Meeting, 1908, expressed the opinion that those payments should be made compulsory on the local supervising authority—that is, the town council. This view was pressed upon the Departmental Committee appointed by the Privy Council in 1909; also that any such scale of fees should be fixed by the Local Government Board. The Departmental Committee agreed that the scale should be fixed by the Local Government Board, but recommended that the fees be paid by the Boards of Guardians. In April, 1910, the Medico-Political Committee of the British Medical Association laid down a scale of fees, which, though later amended in detail, is practically that in existence now. In the same year the Government introduced into the House of Lords, but subsequently withdrew for amendment, an amending bill, and the Association took the opportunity of making representations to the Privy Council and the Local Government Board, and asked the President of the Board (Mr. Burns) to receive a deputation, which he did on November 8th. The bill was subsequently dropped.

The Local Government Board now intimates to the British Medical Association that it is approving, in connexion with schemes for the payment of doctors called in by midwives, the scale which the Association laid down in 1910, and was prepared to put before the Board then. The schemes so approved by the Board would appear to be those of the local supervising authority—a reversal of its 1908 policy of using boards of guardians, and in conformity with the views urged by the Association in 1910. It should be pointed out, however, that whereas the Association has urged that payment should be made for all cases, the letter of the Local Government Board only agrees to payment for necessitous cases.

The Cocaine and Opium Regulations.

In the JOURNAL of November 17th, 1917, p. 657, appeared an explanatory statement regarding the Cocaine and Opium Regulations under the Defence of the Realm Act. There is reason to believe that some medical practitioners still

fail to comply strictly with the terms of Regulation 40B, either by omitting to indicate that a prescription containing cocaine is not to be repeated, or by failing to state their professional qualifications. Such irregularities are probably due to a misapprehension. While prescriptions issued for National Insurance purposes on the forms provided by Insurance Committees need not be marked with the practitioner's address and qualifications, nor with the words "not to be repeated," this does not apply to prescriptions given to their private patients by insurance practitioners. Pharmacists are forbidden to supply these drugs unless the terms of the regulations are strictly complied with in all respects.

INDIAN MEDICAL SERVICE:

MEMORANDUM

ON ITS PRESENT POSITION AND THE REFORMS NECESSARY

SUBMITTED BY THE BRITISH MEDICAL ASSOCIATION TO THE SECRETARY OF STATE.

The following memorandum has been presented by the British Medical Association to the Secretary of State for India. It will be remembered that in October, 1917, the Association asked the Secretary of State to receive a deputation, to lay before him the causes of the present unsatisfactory position of the service, and of its consequent unpopularity in the schools. Mr. Montagu was unable to receive the deputation before his departure for India, but promised to receive it shortly after his return. Meanwhile it was thought well that this memorandum, containing a general statement of the most important points demanding the attention of the India Office in this country and of the Government of India, should be submitted in anticipation of the deputation. It is here published for information.

MEMORANDUM ON THE INDIAN MEDICAL SERVICE.

Preamble.

The British Medical Association submits the following observations in the hope that they may assist the Secretary of State in settling the policy to be pursued with regard to the future of the Indian Medical Service.

The Association is not actuated by selfish or class motives. The officers of the Indian Medical Service constitute less than 2 per cent. of the total number of medical practitioners on the *Medical Register*, issued by the General Medical Council under the authority of the Privy Council; and the abolition of the Indian Medical Service would not appreciably affect the prospects of the medical profession in the British Empire or of the medical schools and Universities.

The Association assumes that the maintenance of an efficient Indian Medical Service is essential to the interests of the peoples of India, and that the duty of ensuring an efficient service appertains to the Secretary of State and the Government of India.

The Association is interested in the matter in so far as, for the honour of the profession it represents, it is anxious that the Secretary of State and the Government of India should not fail to obtain an efficient service owing to lack of information the Association may be able to supply.

The Association is concerned that the Government of India should not, through any want of appreciation of social and economic conditions as they affect the medical profession, or through a want of acquaintance with conditions governing the progress of medicine, surgery, pathology and hygiene, pursue a policy which must in the near future deprive India of the benefits which a highly efficient and skillful medical service has had the privilege of rendering in the past.

The Association is aware that the officers of the Indian Medical Service are extremely discontented and that they deeply resent the treatment to which they have been subjected by the Government of India and also, and more especially, by Local Governments. It is confident that the knowledge of this discontent and resentment has deterred, and must in the future deter, young men from entering the service, and the authorities of medical schools from advising them to do so.

The Association begs to inform the Secretary of State that in order to ensure to India an efficient and contented Medical Service certain reforms are necessary, certain defects must be remedied, and certain general conditions be fulfilled as follows:—

INDIA OFFICE.

Defects.

There is need of a fuller recognition by the Secretary of State and the Government of India of the obligation on all governments to-day to apply the best modern means for the treatment of diseases and for the investigation of their causes with the view to prevention. To this end the Secretary of State, the Governor-General, and the Governors of Provinces need direct and continuous skilled advice on medical and sanitary problems, especially as to the enquiries and researches required for their solution, and as to the application of the results of such enquiries and researches by administrative action. The adviser should in each case be in a position to take a direct part in discussions preceding the decisions of the executive authority.

Remedies.

The Secretary of State has already taken a step towards remedying this defect in the case of the India Office at home. By the Order in Council of June 20th, 1916, the Secretary of State for India provided that the President of the Medical Board at the India Office shall also be the Medical Adviser to the Secretary of State for India. All reports and communications regarding medical and sanitary matters, and the organisation, personnel, recruitment and appointment of officers in the Indian Medical Service, and of persons to the nursing and sanitary services, are referred to him for his advice acting in his capacity of Medical Adviser to the Secretary of State. He supervises the recruitment of the Indian Medical Service, and for this purpose is authorised to visit centres of medical teaching, in order to bring to the notice of the Secretary of State all questions in connection with recruitment. This officer should be relieved of the duties pertaining to the Presidency of the Medical Board, India Office. He should be the head of a distinct department of the India Office to which all proposals affecting medical and sanitary matters should be referred for advice, and no order, minute or other document relating directly or indirectly to any medical or sanitary matter should be issued by the India Office until his observations thereon have been considered by the Secretary of State, to whom he should have direct access.

GOVERNMENT OF INDIA.

Defects.

There are ten Secretaries to the Government of India in various departments, but no Secretary to the Government in the Medical and Sanitary Department. The Director-General, Indian Medical Service, is not a Secretary to the Government of India and hence his recommendations and the reasons on which they are based reach the Executive, that is to say, the Governor-General and his Council, at second hand.

Remedies.

The Director-General of the Indian Medical Service should be a Secretary to the Government of India in the Medical and Sanitary Department, and the Secretary of the Director-General should be an Under-Secretary to the Government of India in that Department.

PROVINCIAL GOVERNMENTS.

Defects.

A Provincial Government has no Medical Secretary. The Surgeon-General of a Province is not a Secretary to Government, so that his recommendations and the reasons on

which they are based reach the Executive of the Province at second hand (if at all).

Remedies.

In each Province the Surgeon-General should be a Secretary to Government in the Medical and Sanitary Department, and his Personal Assistant should be an Under-Secretary to Government in that Department.

EDUCATION AND RECRUITMENT.

Defects.

1. At present permanent commissions in the Indian Medical Service are being granted without examination, and a large number of temporary commissions are being issued.

2. Not only the competitive examination but also the training for it should be as practical as possible. Candidates from India are not required to undergo any period of training in British medical schools, and in consequence their acquaintance with certain subjects, especially the diseases of women and children, may be insufficient.

3. Ordinary leave had, before the war, become difficult to obtain at the time it was due and was often postponed for long periods. The same was true of Study leave.

4. The Government of India does not afford sufficient incentives to officers, I.M.S., to devote themselves to scientific investigation of the causes and the prevention of disease which it should be its special anxiety to encourage. It does not afford sufficient facilities, though the work of the Indian Research Fund has to some extent removed this reproach, and it does not afford them sufficient recognition and distinction, nor provide them adequate emoluments.

Remedies.

1. The practice of giving permanent commissions only on the result of open competitive examination should be resumed as soon as war conditions permit. The number of permanent commissions given by selection should be kept within the narrowest possible limits. It should be made plain that the grant of a Temporary Commission, Indian Medical Service, does not afford any presumption that the recipient will eventually be granted a permanent commission except on the ground of professional knowledge and ability.

2. Successful candidates for the Indian Medical Service should be encouraged to hold resident hospital appointments, being seconded for this purpose.

Candidates from India should be required to undergo a period of training in British Medical Schools, especially in the diseases of women and children, and should, if necessary, be given special facilities for this purpose.

3. Leave should be granted when due, and the cadre should be increased so as to permit reserves for leave, deputization and training. The regular grant of Study leave to junior officers to attend courses of instruction in medical schools, hospitals, and laboratories, in order to make themselves practically acquainted with the advance of scientific methods, is essential to the efficiency of the Service, and provision should be made for them when fixing the establishment of Medical Officers.

Opportunities should be afforded to Officers during the early part of their service to attend the practice of hospitals in the Presidency and other large towns.

4. The Government of India should regard it as one of its first duties to encourage scientific investigation by officers, I.M.S., and should take care that such work received conspicuous marks of its approval and appreciation both by the granting of suitable promotion and adequate remuneration, and in the bestowal of honours.

PAY AND EMOLUMENTS.

Defects.

The prospects for a young man entering the Indian Medical Service have ceased to be attractive owing to:—

1. The low scale of pay, and the lack of opportunities open to members of the Indian Medical Service of attaining to offices carrying large emoluments. The pay of the Director-General, Indian Medical Service, the most highly paid appointment open to the Indian Medical Service, is only 3,000 rupees, whilst that of the Secretaries to the Government of India is 4,000 (as a rule).

2. The diminution of the emoluments to be obtained from private practice. This is due in large part to the action of Government.

3. The decline in the value of money and the increased cost of living.

4. The serious expenses, much exceeding the present inadequate allowance, attendant on frequent transfers from one post to another.

Remedies.

1. There should be a substantial increase in the scale of pay throughout the service; the emoluments of the highest posts, the possibility of attaining to which may induce officers not to retire, should be revised, so that they shall better correspond to the salaries paid to the occupants of posts involving similar grave responsibilities.

2. The curtailment of the right to receive fees from private patients is (a) impolitic since that right remains one of the chief attractions of the service to men who have a prospect of a career in Europe, and an incentive to officers of the service in civil employ to maintain and increase their knowledge and skill. It is also (b) contrary to the plain terms of the conditions under which candidates seek admission to the service.

Any rule or order curtailing, whether directly or indirectly, the right to receive fees from private patients should be at once withdrawn. The Association desires a definite assurance from the Secretary of State for India that the Officers of the Indian Medical Service retain the right to private practice save in the case of certain specified appointments.

3. The decline in the value of money and the increased cost of living should, pending the revision of the scale of pay recommended, be met by a substantial allowance.

4. The frequency of transfers should be reduced as far as possible; an officer transferred should receive an adequate allowance for travelling.

THE ORGANIZATION OF THE PROFESSION AND RURAL PANEL PRACTITIONERS.

SIR,—I read with interest the speech of Dr. Cox on "the organization of the profession," delivered at Preston on November 29th, 1917, and reported in the SUPPLEMENT, BRITISH MEDICAL JOURNAL, December 15th, 1917 (p. 117).

As representing the practitioners on the North Riding Yorks Insurance Committee, a county which is largely rural, and containing some of the largest and most scattered rural practices in England, I should like to ask what the Insurance Acts Committee has done "to discover the will of their constituents so far as rural practitioners are concerned? or when the Association applied its machinery to the business of finding out what it was that (rural) practitioners wanted"? I believe I am correct in stating that the Insurance Acts Committee, or other committee, has a subcommittee appointed to look after rural interests and advise thereon. I should like to know if this subcommittee was consulted when the terms for attending discharged and disabled soldiers in rural districts were agreed upon.

In dealing with a proposed increased capitation fee for 1918, and non-signing of agreements, Dr. Cox says this portion of the resolution was "withdrawn after discussion because of the evident impracticability of collecting within one month the resignations of 80 per cent. of panel practitioners," and later, "obviously the first thing to do was to find out how far the individual practitioners were prepared to go, and to do this and collect the resignations could not be carried through in the brief time available."

Will Dr. Cox kindly say which year since the Insurance Act has been in force the Insurance Commissioners have given sufficient time between presenting a new agreement and its coming into force to allow anything of this nature to take place? So far as my memory goes the Commissioners have always produced the new agreement at the eleventh hour, when there was no time for discussion, and certainly no time for any committee "to discover the will of their constituents." If the Committee really mean business it is about time to move now for the 1919 agreement, if they can get it from the Commissioners.

The Insurance Acts Committee and the Commissioners have been so long in giving attention to or correcting the just grievances of rural practitioners, it would almost appear neither body yet fully understood the fundamental differences between town and country practice as applied to work under the Insurance Act. Without much examination or comparison it is quite easy to realize that in rural practice the distances are longer, the patients fewer, the expenditure of time per visit greater, the work harder, the working expenses higher, the cost of drugs heavier, and so forth; but other and serious differences are not so obvious without experience or closer study of the subject. In town practice, when many serious medical or surgical cases occur, the patients may easily be advised to go to the hospital or call in a consultant, and, if the panel practitioner cares to do so, here his responsibility ends.

Although this might be strictly legal in the country, it is impossible in most cases in a scattered area, and the panel doctor has, therefore, to see all the cases through himself. This leads one to another aspect of rural practice. In attending tedious cases of this kind many long journeys have to be travelled, which means time and money.

In these circumstances, without taking time or exertion into consideration, it is quite easy—in fact, common—for one patient in an outlying district, not only to swallow up in working expenses the capitation and mileage grant for the year of himself and those about him, but the total fees of all panel patients living within a wide area of the patient's residence. This is not possible in a town practice. I always understood one of the golden rules in ordinary insurance work was to adjust the premiums according to the risks incurred. Yet here we have the same capitation fee or premium for town and country alike, although the risks incurred in out-of-pocket expenses are widely different. Again, many workmen seriously injured, or after sudden onset of disease in the town, are taken straight to the hospital, but in rural areas all are attended by the panel doctor—a further example of increased liability.

Another difference is the class of patient transferred from the private on to the panel list in the two classes of practice. In the country many patients who, or their employers, previously paid from 5s. to 10s. a visit, such as domestics in county houses, farmers' sons, etc., are now on the panel list. Very few patients previously paying such fees in towns have been transferred to the panel I should think. Up to the present time, in spite of this glaring injustice, nothing has been done to improve the lot of the rural practitioner. Can it be that the Insurance Acts Committee, or the Commissioners, think the rural practitioners are of no consequence? If so, they are greatly mistaken. If it ever comes to resignation from the panel, where does the Insurance Acts Committee think it has the stronger lever or the best prospect of success, in the town or in the country? Much of the town panel practice could be run by whole-time officers from dispensaries or other institutions, and what is more could be worked at much the same cost. I do not say it would be so good, or so popular, but it could be worked without great difficulty. Try the same in the country, however; expense alone would prevent it. It would cost at least three times as much as the present capitation grant, probably a great deal more, not to mention other insurmountable difficulties perhaps hardly dreamt of and certainly not understood by the Commissioners. Therefore, if it comes to a fight, it might in the end serve the best interests of the town practitioner if they viewed this question of capitation fee for the country with a sympathetic eye. The rural practitioners are not afraid; they have nothing to lose; and if the Insurance Acts Committee will do nothing to try to rectify the glaring injustices when the proposed increased capitation grant is under consideration, country practitioners are quite prepared to act on their own behalf.

When the Insurance Bill was first considered and the capitation fee arranged "with no deductions," I believe the original intention was to divide the capitation grant in such a way that the rural practitioners would receive payment on a higher scale than the town doctor for very obvious reasons, but this was never carried out as at first intended. What rural practitioners would like to know is whether this question is going to be reconsidered when the new increased capitation rate is granted, or whether they are still to be left with this gross injustice unremedied—an injustice so glaring that it should in all fairness be the first thing to be considered, and fully considered, before going into the larger question of any general capitation increase. A basis on which to work would not be difficult to devise—for instance, according to the density of population, and density of population can easily be translated into average miles per visit. In wide practices in the North Riding, where the number of people per acre is low, the average miles per visit work out in some cases as high as five miles, some perhaps higher. Is it reasonable, is it fair that such practice should be worked on the same capitation basis as the crowded town areas?

I am pleased to note a glimmer of hope in the letter from the Commissioners under date December 19th promising increased mileage in rural areas, an increase long overdue, and trust this may be a forerunner for the

removal of the greater grievance. Dr. Cox said: "It was incumbent upon all who had to deal with the Government and other bodies that they should bring forward a reasonable case, and be prepared to discuss it on its merits." If any such reasonable case is wanted, and one which will bear discussion and close investigation on its merits, the Committee might do worse than take up the case of the rural panel practitioner.—*am, etc.,*

Northallerton, Jan. 6th.

WILLIAM BAIGENT.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are announced by the Admiralty:—
Fleet Surgeons S. Connor, M.B., to the *Firid*; W. H. S. Stalkart, M.B., to R.N. Auxiliary Hospital, Peebles; A. C. Manson, F.R.C.S., to the *Crescent*, for Peebles R.N. Auxiliary Hospital; A. H. H. Vizard, M.B., to Sherness Barracks and Yard. Staff Surgeons M. W. Haydon to the *Forth*; G. Carlisle to R.N. College, Greenwich. Temporary Surgeons G. L. Ritchie, M.B., to the *Blonde*; W. P. Startforth, M.B., to the *Penbrooke*; T. R. S. Thompson to the *Firid*; L. H. Woods to the *Hegmouth*; J. E. Purvis, M.B., to Chatham Hospital; J. G. Gilruth, M.B., to Plymouth Hospital; J. A. Starling, M.B., J. G. McG. Robertson, M.B., and G. Bulsille, M.B., to Haslar Hospital. To be temporary Surgeons: J. G. Gilruth, M.B., J. E. Purvis, M.B., R. T. D. Roberts, F. Caldecott, M.B., B.S., C. W. Armstrong, M.B.

ROYAL NAVAL VOLUNTEER RESERVE.

Surgeon D. D. E. Macintyre promoted to Staff Surgeon; Surgeon A. E. W. Hird to Granton Naval Hospital. To be Surgeon Probationers: J. Grant, W. R. P. Templeton, W. L. Tullis.

ARMY MEDICAL SERVICE.

Colonel M. P. C. Holt, K.C.M.G., C.B., D.S.O., to be temporary Surgeon-General.

Lieut.-Colonel H. M. Morton, D.S.O., M.B., to be temporary Colonel whilst employed as Assistant Director of Medical Services of a Division, October 29th, 1915 (substituted for notification in the *London Gazette* of January 12th, 1917).

To be temporary Colonels: Temporary Lieut.-Colonel T. R. Elliott, M.D., Temporary Captain Owen Richards, D.S.O., M.D., F.R.C.S., Temporary Major (acting Lieut.-Colonel) A. E. Webb-Johnson, D.S.O., G. E. Gask, D.S.O., F.R.C.S. (Major K.A.M.C. (T.F.)).

Temporary Colonel Sir A. Macfarlane (Colonel A.A.M.C.) relinquishes his temporary commission.

Lieut.-Colonel F. S. Penny, C.M.G., C.B., relinquishes the rank of temporary Colonel on reposting.

Lieut.-Colonel F. J. Brakeuridge, C.M.G., to be temporary Colonel whilst employed as Assistant Director of Medical Services of a Division.

ROYAL ARMY MEDICAL CORPS.

Major H. C. Hildreth, D.S.O., relinquishes the acting rank of Lieut.-Colonel on reposting.

To be acting Lieut.-Colonels while in command of a medical unit: Majors G. G. Tabuteau and A. R. Greenwood, Captain C. M. Drew, M.B.

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

T. D. Redwick, late Captain, is granted the honorary rank of Captain.

Lieutenants to be Captains: B. Mountain, M. J. Burns, M.B., C. Weir, J. A. H. Miller, W. M. Morris, M.B.

To be Lieutenants: J. A. Stewart, M.B., from Glasgow University Contingent O.F.C., Second Lieutenant F. L. Richard, M.B., from Unattached List T.F., C. H. Warner and F. Cameron from University of London Contingent O.T.C., A. Winfield from Manchester University Contingent O.T.C., J. L. D. Buxton, E. P. N. Creagh, T. F. Lloyd.

OVERSEAS CONTINGENTS.

CANADIAN ARMY MEDICAL CORPS.

Temporary Major R. H. MacDonald, M.C., to be acting Lieut.-Colonel and to command a Canadian Field Ambulance, vice Lieut.-Colonel C. F. McGuffin, D.S.O.

Temporary Major H. H. Moshier to be acting Lieut.-Colonel, D. H. Paterson to be temporary Captain.

SOUTH AFRICAN MEDICAL CORPS.

Captain J. W. Lee is cashiered by sentence of a general court-martial (August 13th, 1917).

TERRITORIAL FORCE RESERVE.

Surgeon-Major (honorary Surgeon Lieut.-Colonel) R. Bullock from Yeomanry to be Surgeon-Major.

Captain R. G. Wills, M.B., relinquishes his commission on account of ill health, and is granted the honorary rank of Captain, November 11th, 1917 (substituted for announcement which appeared in the *London Gazette* of November 10th, 1917).

VACANCIES.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice (see Index to Advertisements—Important Notice re Appointments) appearing in our advertisement columns, giving particulars of vacancies as to which inquiries should be made before application.

AUSTRALIAN COMMONWEALTH: SERUM LABORATORIES.—(1) Biochemist. (2) Two Senior Bacteriological Technical Assistants. (3) Three Bacteriological Technical Assistants. Salary for (1), £450, increasing to £500; (2) £336, increasing to £408; and (3) £216, increasing to £312.

BIRKENHEAD BOROUGH HOSPITAL.—Junior House-Surgeon. Salary, £170.

BIRMINGHAM EDUCATION COMMITTEE.—Temporary Assistant School Medical Officer. Salary, £300 per annum and £5 travelling expenses.

BOURNEMOUTH: ROYAL VICTORIA AND WEST HANTS HOSPITAL.—Resident House-Surgeon. Salary, £350 per annum.

BRISTOL ROYAL INFIRMARY.—(1) House-Physician. (2) House-Surgeon. Salary, £120 per annum.

COSFORD RURAL DISTRICT COUNCIL.—Medical Officer of Health. Salary, £100 per annum.

COSFORD UNION.—Medical Officer and Public Vaccinator for the Cosford Relief District. Salary, £50 per annum.

COVENTRY AND WARWICKSHIRE HOSPITAL.—House-Physician. Salary, £300 per annum.

GREAT NORTHERN CENTRAL HOSPITAL, Holloway Road, N.—Honorary Medical Officer, in charge of Electro-Therapeutic and Massage Department.

HASTINGS: EAST SUSSEX HOSPITAL.—House-Surgeon. Salary, £150 per annum.

HOSPITAL OF ST. JOHN AND ST. ELIZABETH, Grove End Road, N.W.—Resident Medical Officer. Salary, £250 per annum.

INVERANON PARISH, Banffshire.—Medical Officer. Salary, £75 per annum.

LIVERPOOL: DAVID LEWIS NORTHERN HOSPITAL.—House-Surgeon (male). Salary, £150 per annum.

LIVERPOOL PARISH.—Resident Medical Officer for the Browlow Hill Poor Law Hospital. Salary, £300 per annum.

MANCHESTER: COUNTY ASYLUM, Prestwich.—Locumtenent. Salary, £7 7s. per week.

PORTSMOUTH PARISH.—Fifth Assistant Medical Officer for the Workhouse Infirmary, etc. Salary, £300 per annum.

PUTNEY HOSPITAL, S.W.—Resident Medical Officer. Salary, £150 per annum.

QUEEN'S HOSPITAL FOR CHILDREN, Hackney Road, E.—(1) House-Surgeon; salary at the rate of £100 per annum. (2) Temporary Medical Officer to act as surgeon in charge of the Ear, Nose, and Throat Department. Honorarium, £25 per annum.

RATHDOWN UNION.—Medical Officer for the Bray No. 1 Dispensary District. Salary, £125 per annum, rising to £165.

ROCHESTER: ST. BARTHOLOMEW'S HOSPITAL.—Resident Clinical Assistant. Salary, £110 per annum.

ROMSLEY HILL SANATORIUM, near Birmingham.—Assistant Medical Superintendent. Salary, £350 per annum.

ROYAL FREE HOSPITAL, Gray's Inn Road, W.C.—Medical Registrar (female).

SALFORD POOR LAW UNION INFIRMARY.—Male Resident Second Assistant Medical Officer. Salary, £300 per annum.

SHEFFIELD ROYAL INFIRMARY.—House-Physician. Salary, £120 per annum, rising to £150.

STAFFORDSHIRE, WOLVERHAMPTON AND DUDLEY JOINT COMMITTEE FOR TUBERCULOSIS.—Two Senior and two Assistant Tuberculosis Officers. Salary for senior officers £500, and £350 for assistant officers.

SWANSEA EDUCATION COMMITTEE.—Assistant School Medical Officer. Salary, £350 per annum.

VICTORIA HOSPITAL FOR SICK CHILDREN, Tite Street, S.W.—House Surgeon. Salary, £200 per annum.

CERTIFYING FACTORY SURGEON.—The Chief Inspector of Factories announces the following vacant appointment: Holywell (Flint).

To insure notice in this column—which is compiled from our advertisement columns, where full particulars will be found—it is necessary that advertisements should be received not later than the first post on Wednesday morning. Persons interested should refer also to the Index to Advertisements which follows the Table of Contents in the JOURNAL.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 6s., which sum should be forwarded with the notice not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

MARRIAGE.

MENSON—LAMBERT.—On December 24th, 1917, at Ferriby Parish Church, by the Vicar, the Rev. Harris Lloyd, Captain Ronald Kelberoe Merson, R.A.M.C., son of Dr. and Mrs. Merson of Willeby, to Dorothy, daughter of Mr. and Mrs. H. C. Lambert, Wold Edge, Ferriby, East Yorks.

DEATH.

ROTHERA.—On January 5th, 1918, at Beeston, Notts, Frank Rothera, M.D. Edin., M.S., M.R.C.S.E., M.O., aged 56 years.

DIARY FOR THE WEEK.

ROYAL COLLEGE OF SURGEONS, Lincoln's Inn Fields, W.C.—Monday, Wednesday, and Friday, 5 p.m., Professor Arthur Keith: Principles Underlying the Treatment of Injuries to Muscles, Joints, and Bones.

ROYAL SOCIETY OF MEDICINE.—Tuesday, 5 p.m., General Meeting of Fellows. Section of History of Medicine: Wednesday, 4.30 p.m., Exhibition of Books, Pictures, etc. 5 p.m., Dr. R. W. Lefkwich: Shakespeare's Son-in-law, Dr. John Hall. Mr. D'Arcy Power: Dr. John Hall (of Maidstone). Section of Dermatology: Thursday, 5 p.m., Cases. Section of Electro-Therapeutics: Friday, 8.30 p.m., Stereoscopic Radiographs illustrating the Anatomy of the Fallopian Canal. Demonstration of the Radiography of Injuries of the Mandible by Lieutenant H. M. Johnston, R.A.M.C., and Captain Kelsey Fry, R.A.M.C. Mr. E. E. Burnside: (a) A Portable Snook Apparatus; (b) A Transformer for Heating Current of Coolidge Tube.

DIARY OF THE ASSOCIATION.

Date.	Meetings to be Held.
JANUARY.	
16 Wed.	London: Finance Committee, 2.30 p.m.
23 Wed.	London: Council Meeting, 11 a.m.

THE EDUCATION BILL.

THE following is an abstract of the agreed report of a deputation from the British Medical Association which waited upon the Right Hon. H. A. L. Fisher, M.P., President of the Board of Education, on December 14th, 1917.

The deputation consisted of Drs. H. B. Brackenbury, T. Ridley Bailey, John Clarke, C. E. S. Flemming, T. W. H. Garstang, and H. C. Maetier, Mr. N. Bishop Harman, Dr. Alfred Cox (Medical Secretary), and Dr. J. Neal (Deputy Medical Secretary). Sir Amherst Selby-Bigge, K.C.B., Sir George Newman, M.D., and Mr. Bosworth-Smith were present in support of the President.

In a brief speech Dr. GARSTANG introduced the chief spokesman of the deputation, Dr. BRACKENBURY, who said that the British Medical Association objected to the provisions of Clauses 18 and 19 of the Education Bill in their present form, and stated that their proposal was that "extension of the powers of medical treatment should be for the time being excluded from these clauses." He gave the following reasons for their objection:

(a) If the clauses go as they at present are, they will add immediately and seriously to the difficulties of an already chaotic muddle.

(b) They will prejudice by considerable confusion any steps which the Government might take in another direction to simplify the existing state of things.

(c) They will act prejudicially to the position of the general medical practitioner and through him to the detriment of the public.

Dr. Brackenbury then went on to particularize the objections of the Association which he had already stated in general terms.

THE PRESIDENT replied to the deputation as follows:

Gentlemen,—I thank you for the clear way in which you have stated your case, and I will give careful consideration to the weighty opinions which you have offered me. I am fully sensible of the difficulties involved in this question. I take it I may assume that your Association is in favour of the inspection of school children by the school medical service, and that you are in favour of the extension of this service with the extension of the education system, and that you feel that if the age of attendance is to be raised it is desirable that the local education authority should be the agency for medical inspection, and that that agency should be in the hands of the school medical service. Why you have joined issue with the bill is that you would have preferred treatment to have been left out. In any event, you consider it important that treatment of children of all ages should be left to the private practitioner, or at any rate that the position should not be compromised until a Ministry of Health has been set up, or until the Public Health Services have been reorganized and co-ordinated.

After an expression of thanks to the President, the deputation withdrew.

THE ORGANIZATION OF THE PROFESSION AND RURAL PANEL PRACTITIONERS.

SIR.—I should like to be permitted to welcome the forceful letter of Dr. Baigent as an admirable statement of the case for differential treatment of the rural insurance practitioner. I am entirely without personal experience of any but urban practice, but I am now in my second year of chairmanship of the Rural Practitioners Subcommittee, which was appointed in consequence of a suggestion made by me at the Conference of 1916. The work of this subcommittee has enabled me to realize in a way that would otherwise have been impossible the position of rural practitioners and their claims to preferential remuneration under the Insurance Acts.

The tone of impatience which is evident in Dr. Baigent's letter is natural enough. His experience from day to day gives him a vivid consciousness of the disadvantages and inequity of the present state of things. But these things, in my opinion, have never adequately been brought before the profession or before the Insurance Acts Committee or the Association. Recent reforms which have resulted in an enlarged and reinforced Rural Subcommittee and a much increased representation of rural practitioners on the Insurance Acts Committee itself, are now beginning to produce their effect. That action is overdue I know, but these changes cannot be accomplished by one coup, and all effective reforms are painfully slow in maturing. This characteristic is not confined to those desired by insurance practitioners and by the Insurance Acts Committee.

The position is now this. Strong representations have been made to the Government that, owing to conditions produced by the war, there is need for an increase both of the ordinary capitation fee and of the amounts allowed for mileage (both ordinary and that for temporary residents and for invalided soldiers). The mileage claim has been allowed, and the increased capitation claim is being considered, we hope favourably. This is not a bad beginning. But the reconsideration of remuneration on a more permanent basis remains, and may have to be insisted upon almost at once if the results of our present negotiations should be regarded as unsatisfactory. In this connexion, whether sooner or later, the preferential treatment of rural practitioners must be fully considered. Whether an equitable result can be secured by a reformed mileage scheme or in some other way, or whether there should be a larger capitation fee for rural than for urban practitioners, is one of the important matters. In case the latter is asked for, there are several requirements that must be fulfilled: (1) The rural practitioners must convince their fellows in the towns that such an arrangement is just; (2) the profession must convince the Government that this is right in principle; (3) it must be shown that the arrangement is administratively possible. This last point is not by any means so simple as it seems to some, for there are all sorts of practices intermediate between the truly rural and the purely urban. But even the first of the three requirements has not yet been met; and, convinced as I am that the rural

practitioner's ease is a just one. I hope that such presentations of that case as that contained in Dr. Baigent's letter will continue to be put before the profession in the JOURNAL, in Panel Committees, and elsewhere, so that urban practitioners may be shown what equity demands, and so that when a considered request is put forward it may be at the instance not of rural practitioners only, but of the whole of those who are doing work under the Insurance Acts.—I am, etc.,

London, N., Jan. 14th.

H. B. BRACKENBURY.

SIR,—Dr. Baigent's letter in the SUPPLEMENT of January 12th is very much to the point. At the Conference of Representatives held on October 18th, 1917, Dr. Brackenbury stated that the Rural Subcommittee was not specially consulted on the matter of discharged disabled soldiers. He also stated that the Rural Subcommittee was working very well. To those of us concerned by their work it would be interesting to learn something of the nature of the operations of this subcommittee. The following examples show that the present rates of payment for either temporary residents, disabled soldiers, or insured persons are inadequate:

Example 1: Temporary resident 4½ miles: serious accident; 21 visits morning and evening.

	£	s.	d.
Fees earned	2	19	6
Mileage allowed, 1s. per mile over 3 miles one way	1	1	0
	4	0	6
Total distance 178 miles at 6d. per mile ...	4	9	0
Loss on case	0	8	6

Example 2: Temporary resident 8½ miles away; 4 visits.

	£	s.	d.
Fees earned	0	10	0
Mileage allowed	1	0	0
	1	10	0
Total distance 66 miles: hire of car at 10d. per mile both ways	2	15	0
Loss on case	1	5	0

If own car had been available at 6d. per mile, loss on case would only have been 5s.

Example 3: Insured person 9½ miles away; 33 visits morning and night within 2 months.

	£	s.	d.
Capitation fee per annum	9	0	
Mileage allowance per annum	15	2	
	1	4	2
Total distance 600 miles, cost at 6d. per mile...	15	0	0
Loss on case	13	15	10

There are twelve other insured persons in this locality at a distance of eight to ten miles, the value of their capitation fees and mileage allowance was £14 10s. per annum; if we deduct the loss on above case 14s. 2d. remains to cover the risk of attending these twelve persons for the remaining ten months of the year.

These cases are not exceptional; something of the same kind happens every year. The motor car is, without doubt, a boon to the country practitioner; whether it is an unmixed blessing must depend on our capacity to be reimbursed for the cost of using it. It is not easy to make exact calculation of the cost as compared with the horse, but, as regards the latter, it may be said that the more work the noble animal did the less the cost, with the car the more work the greater the cost. Which of us who are getting on in years cannot recall the doctor's mare costing £40 as a four-year-old and retiring to the stud after ten years' work to produce a useful foal or two; or the cob which was bought for £30 as a three-year-old and sold for £30 at six or eight years. To say nothing of the nearly extinct dogcart, good for fifteen years, and the almost everlasting saddle and bridle, and the sometimes faithful groom at 18s. a week: as also the good old days when we hired horse and trap from the local hotel at a charge of 1s. a mile on the outward journey and drove home for nothing? It is difficult nowadays to realize that we ever got over the ground in the day, but we did. To-day we get the amenities of the car to the advantage of ourselves and the public, but it has to be paid for. The groom at 18s. a week is replaced by the chauffeur at 30s.; the £300 car has to be sold for £50 at the end of five or six years, and

may have had £50 spent on it during the time, and the new car costs as much as one can afford and sometimes more; petrol, tyres, and oil are probably more expensive commodities to-day than hay, corn, and horseshoes in the past, and the local hotel charges 10d. a mile (1s. to-day) all the way. No self-respecting taxi-driver would take on a contract to drive his car six miles for nothing, or even twenty miles for 7s., an indefinite number of times, yet this is what we have to do under the mileage allowance for temporary residents.

The army allowance is a fairer one, and having been conceived by a Government department is not likely to err on the side of extravagance. The Medico-Political Committee is reported to have stated that our proper remedy to cope with our increased travelling expenses is to put up our fees. This is a counsel of perfection; unfortunately a proportion of our most distant patients are also the poorest; the profession has always tempered the wind to these shorn lambs, and must always do so, for obvious reasons; but that is no reason, when dealing with a State department, why we should acquiesce in playing the part of the shorn lamb, or sell our wool at less than cost price. As Dr. Baigent says, the large amount of time occupied in paying visits at a distance of many miles is a serious matter for some rural practitioners.

The situation as regards the allowance for drugs is almost Gilbertian. In spite of a rise in price of drugs and appliances from 20 to 200 per cent. we are docked 20 per cent. on the amount due on the plea of "inflation of life," but only 15 per cent. of capitation fees on the same plea: in this rural district the "inflation" is probably not more than 5 per cent., if as much. If the drug allowance was not too much in 1913 it is certainly too little for the following years. This is a subject which it is to be hoped the Rural Subcommittee will bear in mind and will be consulted upon by the Advisory Committee.—I am, etc.,

January 13th.

"ONLY" A COUNTRY DOCTOR.

SIR,—I have read with much interest Dr. Baigent's letter on rural practitioners, in the SUPPLEMENT of January 12th.

I can fully endorse all that he says concerning the additional trouble and expense entailed in attending insured persons in rural districts, for though residing in the borough of Oldham, a large proportion of my work lies in part of the West Riding of Yorkshire. It is particularly gratifying to learn that the Commissioners have promised an increased grant for mileage in rural areas, but it would be more gratifying to learn that this grant would be paid at the end of each year.

On looking through the balance sheets from the West Riding Committee, I find that the last mileage grant I received was in November, 1916, that being for the year 1915, and even that grant was only 90.3 per cent. of the amount standing to my credit. Apparently equivalent amounts for the years 1916 and 1917 are still standing to my credit with the Commissioners, whereas they might well be gaining interest for me if invested in National War Bonds, which by every post I am requested to "buy now."

This extra grant for long distance work barely covers the increased cost of the petrol consumed in doing the work, yet before the petrol can be even ordered from the dealer, the tax must be paid on it, and the licences for car and chauffeur must be paid, also in advance.

The Prime Minister, in one of his memorable speeches on the Insurance Act, said "there will be no bad debts for the doctors," but what are these delayed and reduced payments? Little better than bad debts! Is the delay in paying the mileage grant another war-time economy, like the reduction of the notification fee?

How many years will the profession tolerate treatment from Government departments such as no right-minded body of working men would stand for months—nay, for weeks? By all means organize the profession and let us demand, not only reasonable fees, but fees paid within seven days of the termination of each quarter.

If the Insurance Acts Committee really means business, let it move now for 1919, not by asking the Commissioners for an agreement, but by laying before them a contract—legally binding to both parties—acceptable to the whole profession.—I am, etc.,

Oldham, Jan. 13th.

ERNEST MARTIN.

SIR,—Dr. Baigent's valuable letter has come at a most opportune time, and will help to focus attention on the claims of rural practitioners. The Commissioners are now considering the request of panel practitioners for an increased capitation fee, and it is incumbent on rural practitioners to press their just claims for favourable discrimination. All Panel Committees should be asked to pass resolutions in this sense, and the resolutions should be sent to the Insurance Acts Committee and the Commissioners; or, better still, the Insurance Acts Committee should consider the advisability of directly inviting an expression of opinion from all Panel Committees on the question of a discriminating capitation fee.

It has been suggested that considerable opposition would come from the large urban centres. But the absurdity of applying the same regulations to such varying conditions as those of urban and rural practice must be patent to every one, and I have every confidence that, provided the matter is properly explained, urban practitioners will give their rural brethren every assistance in evolving an equitable scheme of apportionment of the capitation grant. The Rural Practitioners Subcommittee has not yet had an opportunity of specially considering this question but will no doubt do so at the proper time. The hands of the sub-committee would be greatly strengthened by expressions of opinion such as I have suggested.—I am, etc.,

Towcester, Jan. 14th.

ALFRED LINNELL.

We have received other letters on this subject—for instance, Dr. W. W. Nock (Penkridge), in the course of a letter, writes: Though a rural practitioner, I have never received one penny for mileage. A fortnight ago I wrote to the secretary of my Insurance Committee calling his attention to the increased mileage grant to rural practitioners and asking him to put my letter before his committee. So far I have not had an acknowledgement. If only we rural practitioners would combine, we could certainly enforce fair treatment, which we have never had owing to lack of combination amongst ourselves, and equally to want of support from our urban brethren. Though the present is certainly the psychological moment for a "strike," most of us would not wish to embarrass the Government until the war is over.

Association Notices.

MEETING OF COUNCIL.

THE next Meeting of Council will be held on Wednesday, January 23rd, in the Council Room, 429, Strand London, W.C.2, at 11 a.m.—By order,

GUY ELLISTON,

Financial Secretary and Business Manager.

January 17th, 1918.

INSURANCE.

LOCAL MEDICAL AND PANEL COMMITTEES.

Berkshire.—At a meeting of the practitioners on the Berkshire panel on November 29th, 1917, the report of the Committee for 1916-17 was adopted. It was decided to continue the voluntary contribution of 1d. per insured person per year. It was resolved that mileage should be paid to all rural practitioners for distances exceeding two miles. It was resolved to ask the local food control committees to exercise the powers delegated to them by the Food Controller to conserve a sufficient supply of milk for the use of infants and sick persons.

West Riding of Yorkshire.—At a meeting of the Local Medical and Panel Committee on November 16th, 1917, Dr. Fry gave a report of the proceedings of the October conference, referring particularly to the decisions with regard to the regulations for invalided seamen, marines, and soldiers, and the proposed investigation of the process of calculation of the central pool. It was resolved to pay the expenses of the members attending the conference. It was decided to ask the Insurance Committee to increase the flat rate for surgical dressings from 3d. to 6d. per dressing as from October 1st last.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following announcements are notified by the Admiralty:—Fleet Surgeon E. H. Meaden, C.M.G., is placed on the retired list with the rank of Deputy Surgeon-General. Fleet Surgeons J. A. Keogh, M.B., and F. F. Mabon, to Chatham Hospital, temporarily. Staff Surgeon A. T. Rivers to Chatham Hospital, January 10th, and to Chatham Hospital as Radiographer, February 10th. Surgeons: F. E. Fitzmaurice to the *Victorious*; W. G. Thwaytes, M.B., to the *Alecto*. Temporary Surgeons: A. L. P. Gould, M.B., H. C. Broadhurst, M.B., and R. K. Shaw, M.B., to the *Victory*, for R.N. Division; R. Pollock and R. N. Gibson, M.B., to the *Victory*, for Sailors' Home Auxiliary Hospital, Chatham; D. R. Currock and A. C. Craig, M.B., to Plymouth Hospital; A. O. Ross to the *Roxburgh*; A. J. Hamilton to Haslar Hospital. To be Temporary Surgeon: R. L. Stewart, M.B.

ARMY MEDICAL SERVICE.

Lieut.-Colonel J. H. Campbell, D.S.O., to be temporary Colonel whilst employed as Assistant Director of Medical Services of a Division, November 6th, 1917 (substituted for notification in the *London Gazette* of December 14th, 1917).

Lieut.-Colonel J. H. R. Bond, D.S.O., to be temporary Colonel whilst employed as Assistant Director of Medical Services of a Division.

INSURANCE.

INCREASED MILEAGE GRANT FOR INSURANCE PRACTICE.

THE following communication, dated January 21st, 1918, has been forwarded by the National Health Insurance Commission (England) to the secretaries of Panel Committees:

Sir,—I am directed by the National Health Insurance Commission (England) to enclose, for your information, a copy of a circular letter which they have this day addressed to the Insurance Committee for your area. Your attention is particularly directed to the date in the enultimate paragraph of the letter: in view of this date you will doubtless wish to get into communication with the Insurance Committee without delay.

I am, Sir, your obedient servant,
S. P. VIVIAN.

Extra Mileage Grant on Account of War Conditions.

Sir,—I am directed by the National Health Insurance Commission (England) to inform you that, as a result of representations which have been made to them as to the increased difficulty and cost of travelling in rural areas owing to war conditions, funds have been made available by His Majesty's Treasury which will permit of a substantial increase, by reference to those conditions, as from 1st January, 1917, in the special payments made to rural practitioners in respect of mileage, and will also permit of extra payments for mileage under the scales laid down in the regulations applying to the treatment of temporary residents and of invalided sailors and soldiers.

The Commissioners have had the opportunity of consulting representative rural practitioners on the question of the basis on which the distribution of this sum might proceed, and it has been generally agreed that in areas where payments have hitherto been made to practitioners from the Special Mileage Grant, the most equitable and convenient basis of distribution will be secured by distributing the additional sum available to each Committee as a uniform percentage addition to the sums payable to doctors under the current mileage scheme for the area. It is considered that the simplicity of this procedure and the avoidance of the necessity for detailed discussion between the Insurance Committee and the Panel Committee (involving the collection of fresh and possibly complicated data), will, in general, outweigh any small improvement in precision of distribution which might be possible under a more elaborate scheme.

The Commissioners recognize, however, that in some areas exceptional cases of hardship may have arisen, for which, in the opinion of the Panel Committee, it is essential that some provision should be made by an amendment of the existing scheme. If the Insurance Committee and the Panel Committee consider that some part of the extra grant available to the Committee should be earmarked for such special cases before the general proportionate distribution takes place, the Commissioners will be prepared to consider any proposed amendment giving effect to such provision. If, after consultation with the Panel Committee, it is considered that there are no special cases which would justify the expenditure of time and labour involved in the preparation of a special scheme, the Committee should submit an addendum to their mileage scheme for 1917 providing for the distribution of the

extra war grant among practitioners on the panel in proportion to the sums payable to them under that scheme.

It will be open to the Insurance Committee for a county in which no payments have hitherto been made in respect of special mileage, but in which there has been considerable travelling in attendance on insured persons resident more than three miles from the nearest doctor, to submit to the Commissioners a statement showing the special circumstances which, in the opinion of the Committee, would justify the allocation to them of a portion of the new grant. Any such application for 1917 should be made *within ten days of the date of this letter*. In such areas it will, of course, be necessary to prepare a special scheme for the distribution among practitioners of the sum allocated to the Committee. The Commissioners will be glad to afford assistance in the preparation of this scheme.

The additional mileage payments in respect of temporary residents and invalided men will take the form of a uniform percentage addition to the mileage fees allowed under the appropriate schedules. This will be the subject of a separate communication to the Committee at a later date.

It is essential that the Commissioners should have before them at a very early date all claims which will be made upon the extra grant for the year 1917 in order that they may determine the sum which can be allocated to each Committee. The Committee should therefore at once consult the Panel Committee, and, where an allocation from the extra grant is desired, should prepare and submit the necessary addendum to the 1917 scheme *not later than the 21st February*. In view of the urgency of the matter, a copy of this circular is being sent direct to the Panel Committee with an intimation that they should communicate at once with you on the subject.

A communication will be addressed to you with reference to the mileage grant for 1918 as soon as the claims on the extra grant 1917 have been considered.

I am, Sir, your obedient servant,
S. P. VIVIAN.

The Clerk,
..... Insurance Committee,
January 21st, 1918.

Association Notices.

MOTOR CAR BADGE.

THE Army Council having taken objection to the use of the Red Cross in the motor car badge as issued by the Association, it is necessary at once to withdraw those badges already issued to members. A new design is under consideration, and will be issued as soon as practicable.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are announced by the Admiralty: Staff Surgeons F. G. Wilson to the *Parotous*; H. M. Langdale to the *Groton*. Temporary Surgeons L. Mandel, M.D., and H. W. Cooke to the *Fred*; S. C. Shaw and H. Hurst to Plymouth Hospital; J. P. Ryan to the *Duke of Edinburgh*; D. Bell, M.B., to the *Pembroke*.

ROYAL NAVAL VOLUNTEER RESERVE.

Surg on A. G. L. Reade to the *King George*; Surgeon Probationer G. P. Monk to be Dental Surgeon, and appointed to the *Fred*. To be Surgeon Probationers, G. W. Hollings, E. S. Clayton, W. H. Marston.

ARMY MEDICAL SERVICE.

Colonel C. E. Morgan, C.M.G., M.B., to be Assistant Director of Medical Services at the War Office.
Colonel H. O. Trevor is placed on retired pay, December 10th, 1917, is substituted for the notification in the *London Gazette* of December 25th, 1917.

Corbett, J. E. Fraser, W. W. McKay, F. L. Reid, E. J. Gordon, W. G. Robertson, B. Lyon, C. M. Sellyer, G. L. Sills, J. R. Patterson, B. W. Cannon, H. R. Nicklin, G. S. Purvis, J. M. Clark, G. K. Shinton, J. S. Sutherland, E. H. Whelpley, F. C. Wilson, P. J. O'Dwyer, M. Mackay, T. H. Williams, T. D. Wheeler, C. W. Burns, C. W. Torrance, A. M. Jeffrey, W. E. Brown, H. A. Elliot, H. A. Mitchell, F. G. Eanting, G. M. Dobbin, J. S. Douglas, C. D. Farquharson, D. G. Findlay, C. E. Frain, A. R. Hagerman, C. V. Mills, C. S. Macdonald, R. MacKinlay, A. Montgomery, G. R. Scott, W. E. L. Sparks, F. McN. Johnson, W. V. Barracough, T. W. Bleakley, R. M. Harvie, N. O. Thomas, F. S. Parney, J. F. Adams, H. C. McAlister, W. G. Jamieson, E. D. Hutchinson, D. I. Davis, T. E. White, M. G. Graham, A. Mackay, F. W. W. Hipwell, G. D. Jeffs, D. StC. Campbell, J. D. G. Campbell, J. A. Davies, D. W. N. Gwicker, W. M. MacDonald, R. G. Mahabir.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Majors T. A. Barron and J. R. Harper to be acting Lieut.-Colonels while commanding a field ambulance and a stationary hospital respectively.

The announcement regarding Major A. B. Whitten published in our last issue, p. 12, was incomplete; the following extract from the *London Gazette* of January 1st should replace it: Captain A. B. Whitten, M.B., to be Major, but without pay and allowance of the rank prior to March 23rd, 1916. June 25th, 1915 (substituted for that which appeared in the *London Gazette* of November 19th, 1917).

Major R. B. Sidebottom resigns his commission on account of ill health and is granted permission to retain his rank and to wear the prescribed uniform.

To be Majors: Major J. O. Summerhayes, D.S.O., from R.A.M.C., Captain W. Dyson, M.D.

Captain (temporary Major) D. S. Sutherland, M.D., relinquishes his temporary rank on alteration in posting.

Captain C. F. Coombs, M.D., is restored to the establishment.
The following announcement is substituted for that in the *London Gazette* of March 10th, 1915: Surgeon-Captain G. D. Kettlewell from R.G.A. to be Captain, August 4th, 1914.

CURRENT NOTES.

Motor Car Badge.

IN consequence of the objection taken by the Army Council to the use of the red Maltese Cross in the motor car badge as issued by the Association, it has been decided to print the badge without the red cross. Members who have already received the original design should at once either cut off the upper part of the print on which the red cross appears, or apply to the Financial Secretary and Business Manager, 429, Strand, W.C.2, for a copy of the new print, which will be supplied to them gratis. Members who have not yet ordered a copy of the badge may obtain one of the revised prints on application, price 1s., on the distinct understanding that the member to whom it is supplied will only use it when his car is engaged on professional or other purposes expressly authorized in the Motor Spirit (Consolidated) and Gas Restriction Order, 1918, dated January 3rd, 1918.

The Demand for an Increased Capitation Fee.

As is well known, the last conference of Local Medical and Panel Committees on October 18th, 1917, instructed the Insurance Acts Committee to press for an increase in the capitation fee from 7s. to 10s., this sum to cover the increased liabilities with regard to discharged disabled soldiers and sailors and all services now rendered to tuberculous patients by panel practitioners. This decision was communicated to the Insurance Commissioners by letter on November 5th; a deputation waited on the Commissioners on November 15th; and on December 8th a memorandum was forwarded to the Chairman of the Joint Committee of Insurance Commissioners setting out the reasons for the demand. The memorandum was printed in full in the SUPPLEMENT of December 22nd, 1917; the Commissioners' reply has not yet been received. In reporting these matters to the Council of the British Medical Association on January 23rd, the Chairman of the Insurance Acts Committee pointed out that it might be necessary in the near future to call a conference of Local Medical and Panel Committees for the purpose of considering the reply which is now awaited from the Commissioners. The Council authorized the calling of such a conference if need should arise.

Medical Fees for Private Practice.

As a result of statements in the lay press to the effect that in certain districts medical practitioners were raising their fees, and of requests from many doctors for advice from the Association on this matter, the Council at its October meeting, on the suggestion of the Medico-Political Committee, expressed the opinion that, without prejudice to the sufficiency or otherwise of medical fees before the war, under present war conditions individual or local collective action in the direction of securing an increase of medical fees is justified. Since then in a number of Divisions throughout the country steps have been taken to obtain the opinion of the local medical profession, and in many cases it has been decided that fees for private practice must be raised. There can be no question of the propriety and reasonableness of such a decision. Apart from the greatly increased cost of living, medical practitioners now have to pay more for everything used in connexion with

their work. In the case of country doctors the enormously increased price of petrol would alone justify a higher visiting fee, whilst doctors who do their own dispensing are especially affected by the great rise in the cost of drugs, dressings, and appliances.

Association Notices.

CHANGES OF BOUNDARIES.

Malta Branch.

Notice is hereby given to all concerned of a proposal made by the Malta and Mediterranean Branch that the name of the Branch be altered to "Malta Branch," and that the area of the Branch in future consist of the Island of Malta and its Dependencies.

THE ORGANIZATION OF THE PROFESSION AND RURAL PANEL PRACTITIONERS.

SIR,—Dr. Baigent's letter has at last roused the feelings of country practitioners in regard to the shockingly unfair way in which they are treated as regards payment under the Insurance Act. It clarifies matters and must be most instructive to urban practitioners, who have no conception of the trials of a country doctor. Take myself, for instance; I have a car and a motor bicycle. The former is in dock for repairs, and I have to go over the most appalling roads, all ruts and mud—and what is worse, greasy mud. I am continually skidding and every journey out is an adventure. Imagine what this is like at night when I arrive home, looking as if I had just arrived from the trenches. It has to be endured to be believed. In the course of twenty years' country practice I have been thrown out of a dog-cart three times, off my motor bicycle a good many more than that, not forgetting a rather nasty motor car accident. It is, therefore, not merely a matter of increased payment for mileage, but the conditions under which these journeys are made—increased expense and increased risk as compared with town doctors.

It is indeed high time that country practitioners should act, and in this matter I am sure they will be supported by their town brethren.—I am, etc.,

January 19th.

RUSTICUS.

SIR,—Dr. Ernest Martin, in the SUPPLEMENT of January 19th, asks, "How many years will the profession tolerate treatment from Government departments such as no right-minded body of working men would stand for months?" The answer is, Until the iron has entered the soul of the medical man and the profession realizes that union is strength. He then suggests organizing the profession and making certain demands. For many years the Association has been endeavouring to organize the profession, and the result has so far clearly brought into view the interesting fact that the average medical man, in spite of urgent appeals, remains profoundly apathetic over any matter that concerns his interests. This is sufficiently indicated by the care with which he absents himself from meetings of his Division when business matters or medico-political questions are to be discussed. Possibly a perusal of the history of the German Insurance Act will help Dr. Martin to form an opinion as to how long it will be before the medical profession sinks its individualistic propensities and puts on the strong armour of "Unity," which alone will enable that body to win the fight with any Government department.—I am, etc.,

Torquay, Jan. 20th.

G. YOUNG EALES.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments have been announced by the Admiralty: Staff Surgeons G. C. Cross to the *Indus*; P. B. Egan, M.D., to the *Topaze*; Surgeon G. E. D. Ellis to the *Hazard*. CURRENT NOTES.

Promotion and Pay of Territorial Medical Officers.
We printed in the JOURNAL last week the recommendations contained in the Second Report of the Committee on Promotion of Officers in the Special Reserve, New Armies, and Territorial Force, which dealt with the promotion and pay of officers of the R.A.M.C., Special Reserve, and Territorial Force. While the report itself may be taken as an attempt to do justice to the officers concerned, its practical outcome is clearly unsatisfactory. The first recommendation of the Committee, that "officers of the Royal Army Medical Corps, Special Reserve, and Territorial Force who joined before the war should be put on a level with temporarily commissioned officers as regards pay, allowances, and gratuities where they would gain thereby," went a good part of the way towards meeting the strongest recommendation put forward by the British Medical Association in its memorandum of May last.¹ But this, which was by far the most important of the Committee's six recommendations, was the only one negated by the Government. The report is now being considered in detail by the Naval and Military Committee of the Association with a view to proposals in regard to future action.

The Organization of the Profession and Rural Panel Practitioners.

We regret that we are unable this week to publish several letters on this subject recently received.

Association Notices.

BRANCH AND DIVISION MEETINGS TO BE HELD.

OXFORD AND READING BRANCH: OXFORD DIVISION.—Dr. P. W. M. Higgs (Honorary Secretary, 88, James Street, Oxford), gives notice that a meeting of the Division will be held on Saturday, February 9th, at 3.30 p.m., in the Museum, when a cinema demonstration of war neuroses will be given by Major Hurst, R.A.M.C.

INSURANCE.

THE DEMAND FOR AN INCREASED CAPITATION FEE.

THE Insurance Acts Committee has received a communication from the National Health Insurance Joint Committee in the following terms, dated February 5th, 1918:

"I am directed by Sir Edwin Cornwall to send herewith to the Committee instructed by the Conference of Local Medical and Panel Committees of October last to communicate with him in regard to the resolutions of that Conference, a copy of a letter which he has sent to the Secretary of the Panel Medico-Political Union in reply to communications from that Union."

The letter addressed to the General Secretary of the Panel Medico-Political Union is as follows:

National Health Insurance Joint Committee,
Buckingham Gate, London, S.W.1.

February 5th, 1918.

Sir,—I am directed by Sir Edwin Cornwall to inform you that he has considered carefully your letter of January 30th concerning your Council's "minimum demands" for an increase of capitation fees of all insurance practitioners "from 7s. to 10s. exclusive of drugs," but including the treatment of discharged soldiers, as also the earlier letter of your Council on the same

subject, in which it was stated that the proposed capitation fee of 10s. was not to be regarded as adequate, but as "the minimum which the union is prepared to accept."

Sir Edwin desires me to state that he has for some time been considering the question of various effects that are alleged to result from war conditions upon the rate of remuneration offered in 1912 by the Government and at that time accepted by insurance practitioners, particularly in connexion with certain resolutions adopted by the Conference of Local Medical and Panel Committees last autumn and published at the time in the medical press. Those resolutions were sent to him by the Committee instructed by the Conference (at that meeting) to take that action on their behalf. That Committee subsequently came to this department to discuss the matter, as reported in the BRITISH MEDICAL JOURNAL of November 24th last, and have since been in correspondence with Sir Edwin Cornwall on the subject.

Having regard, first, to the position of the Local Medical and Panel Committees as the *statutory bodies* representative of insurance practitioners and of the profession in their several areas, and, secondly, to the constitution of the Conference as a body of delegates specially elected for the purpose by Local Medical and Panel Committees throughout Great Britain, and instructed by them with reference to an agenda paper circulated before the Conference, Sir Edwin Cornwall considers that he must necessarily regard that Conference as the body representing the opinion of insurance practitioners as a whole. And it is, therefore, necessarily to the Committee for the time being instructed by that Conference to represent them for this purpose that Sir Edwin Cornwall will intimate whatever decision the Government may come to on the question of the remuneration of insurance practitioners.

In these circumstances it would seem to Sir Edwin that no useful purpose would be served, but rather that confusion would be likely to result, from any attempts at negotiations on the same subject between your Council and himself, seeing that your union, as was intimated by the last deputation of your Council here when this point was raised, comprises representatives of a small minority only of the several thousands of insurance practitioners of Great Britain who are affected by the question, unless, indeed, it should be the case (of which he has had no evidence before him) that the membership of your union constitutes a special class of insurance practitioners whose interests in this matter are divergent from those of the insurance practitioners generally of Great Britain.

In connexion with the whole subject, I am to remind you that the important and difficult question of the methods of calculating the actual amount due in respect of the remuneration of insurance practitioners generally throughout the country is being specially investigated, at the request of the Conference above referred to, by a special Committee set up by that Conference (aided, at their request, by the President of the Institute of Actuaries), and that this department is placing at their disposal all the information needed for the elucidation of that problem, which is of necessity an essential part of the whole question of remuneration for insurance practice and closely involved in any suitable solution of it. This investigation is still proceeding.

In conclusion, I am to say that any such demands as those presented by your union would of necessity raise the important question of the kind of services to be rendered by the practitioners in return for the increased remuneration demanded apparently for every insurance practitioner, as also the ways in which these services are in fact being rendered in various parts of the country in respect of the remuneration at present given.

I am, Sir, your obedient Servant,
(Signed) E. JACKFORTH.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are announced by the Admiralty: Temporary Surgeons D. McAlpine to the *Vivid* for R.N. Barracks; A. H. Haynes to the *Emperor of India*; A. G. Brown, M.B., to R.N. College, Dartmouth; J. L. Owen, M.B., to the *New Zealand*; A. W. Walker to Gibraltar; A. L. Abel to the *Donegal*; J. L. Gregory, M.B., to Plymouth. To be temporary Surgeons: F. G. Wood, T. M. Payne, A. S. Shacklock, D. M. Muir, H. B. Jackson, P. N. V. Dyer, C. G. Boney.

¹ SUPPLEMENT, May 19th, 1917, p. 116.

ROYAL NAVAL VOLUNTEER RESERVE.

To be temporary Surgeon: A. W. Mackenzie. To be Surgeon Probationers: R. W. R. Watson, D. Slight, A. E. Beckwith.

ARMY MEDICAL SERVICE.

Surgeon-General R. Porter, C.B., is placed on the retired list. Honorary Colonel Sir Frederick Treves, Bt., G.C.V.O., C.B., to be temporary Colonel.

Temporary Lieut.-Colonel L. S. Dudgeon to be temporary Colonel. Temporary Lieut.-Colonel F. R. Hill, R.A.M.C., to be Deputy Assistant Director-General, vice Lieut.-Colonel F. McLennan.

ROYAL ARMY MEDICAL CORPS.

Temporary Major W. Bickerton Edwards relinquishes his commission on appointment under the Ministry of National Service and is granted the honorary rank of Major, October 17th, 1917 (substituted for notification in the *London Gazette* of December 5th, 1917.)

T. J. Lloyd, N. D. Bardswell, and A. G. Bodman, late temporary Captains, are granted the honorary rank of Captain.

J. F. MacKenzie and E. F. Buckell, late temporary Captains, are granted the honorary rank of Lieutenant.

Lieutenants (temporary Captains) seconded for service with Egyptian Army: S. Arnott, W. H. A. D. Sutton.

M. Brunk to be temporary honorary Lieutenant.

OVERSEAS CONTINGENTS.

CANADIAN ARMY MEDICAL SERVICE.

Deputy Assistant Directors of Medical Services: Temporary Major S. G. Chown, C.A.M.C., vice temporary Captain H. B. Logie, C.A.M.C. Temporary Captain W. S. Macdonnell, C.A.M.C., vice temporary Major E. A. Neff, C.A.M.C.

CANADIAN ARMY MEDICAL CORPS.

Temporary Major (acting Lieut.-Colonel) T. McC. Leask to be temporary Lieut.-Colonel, and to command a Canadian Field Ambulance.

Temporary Major N. B. Gwyn to be acting Lieutenant-Colonel while specially employed.

Temporary honorary Major C. W. Buckley relinquishes his commission.

Temporary Captains to be temporary Majors: (Acting Major) D. A. L. Graham, W. T. Lockhart, A. B. Walter, W. W. Francis, L. H. McKim, L. L. Reford, R. M. Shaw.

Temporary Captains to be acting Majors: H. W. Wadge, M.C., April 21st, 1917 (substituted for *London Gazette* notification of July 26th, 1917, incorrectly describing rank as substantive Major), R. St. J. MacDonald, B. E. Kelly, T. H. Bell, M.C., W. C. Laidlaw.

Temporary honorary Captain F. R. Sawdon relinquishes his commission.

Temporary Captain J. A. McCourt is dismissed the service by sentence of a general court-martial, December 17th, 1917.

BRITISH WEST INDIES REGIMENT.

F. A. Norton, M.D., to be Surgeon-Lieutenant.

TERRITORIAL FORCE RESERVE.

Captains from R.A.M.C. to be Captains: R. W. Meikle, A. Coleridge, H. C. Phillips, C. D. Edwards, M.C., A. H. Savage.

Captain W. G. Lloyd, from 2nd London Field Ambulance, to be Captain.

EXCHANGE.

CAPTAIN R.A.M.C.T., Home Service, at present employed in Northern Command, wishes to exchange into Southern Command.—Address, No. 500, BRITISH MEDICAL JOURNAL Office, No. 429, Strand, W.C.2.

VACANCIES.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice (see Index to Advertisements—Important Notice re Appointments) appearing in our advertisement columns, giving particulars of vacancies as to which inquiries should be made before application.

ALNWICK INFIRMARY.—House-Surgeon. Salary, £150 per annum. BARROW-IN-FURNESS COUNTY BOROUGH.—Assistant Medical Officer, Assistant School Medical Officer, and Assistant Tuberculosis Officer. Salary, £350 per annum (plus war bonus) rising to £400.

BIRMINGHAM AND MIDLAND EYE HOSPITAL.—Resident Surgical Officer. Salary, £250 per annum.

BIRMINGHAM AND MIDLAND HOSPITAL FOR WOMEN.—House-Surgeon (woman). Salary at the rate of £100 per annum.

BIRMINGHAM GENERAL DISPENSARY.—Resident Medical Officer. Salary, £320 per annum.

BOLINGBROKE HOSPITAL, Wandsworth Common, S.W.—House-Surgeon. Salary, £150 per annum.

BRISTOL ROYAL INFIRMARY.—(1) House-Physician; (2) House-Surgeon. Salary, £120 per annum.

BURY INFIRMARY.—Junior House-Surgeon. Salary, £200 per annum.

CHESTER ROYAL INFIRMARY.—Locumtenent House-Surgeon.

COSFORD UNION, Hadleigh.—Medical Officer and Public Vaccinator of the Boxford Relief District. Salary, £50 per annum.

DERBY: DERBYSHIRE HOSPITAL FOR SICK CHILDREN.—Resident Medical Officer (lady). Salary, £200 per annum.

DERBYSHIRE ROYAL INFIRMARY.—Resident Surgical Officer.

DORCHESTER: DORSET COUNTY COUNCIL.—Temporary Lady Assistant Medical Officer. Salary, £350 per annum.

DUDLEY: GUEST HOSPITAL.—Vacancy on Honorary Surgical Staff.

GLASGOW: ROYAL HOSPITAL FOR SICK CHILDREN.—Attendant or Assistant for Pathological Department.

GUY'S HOSPITAL, S.E.—Clinical Assistant for Children's Out-patient Department. Honorarium, 2ls. per session.

HEMEL HEMPSTEAD: WEST HERTS HOSPITAL.—Resident Medical Officer.

HOSPITAL FOR DISEASES OF THE THROAT, Golden Square, W.—House-Surgeon. Salary, £100 per annum.

LINCOLN MENTAL HOSPITAL.—Assistant Medical Officer. Salary, £250.

LONDON TEMPERANCE HOSPITAL, Hampstead Road, N.W.—Casualty Officer (non-resident). Honorarium, £120 per annum.

MANCHESTER: ANCOATS HOSPITAL.—Unqualified Resident (male). Salary, £50 per annum.

NORFOLK WAR HOSPITAL, Thorpe.—Resident Medical Officers.

NORTHAMPTONSHIRE WAR HOSPITAL, Duston.—Resident Medical Officer. Salary, £1 daily.

NORWICH: JENNY LIND HOSPITAL FOR SICK CHILDREN.—Lady Resident Medical Officer. Salary, £350 per annum.

NOTTINGHAM: NOTTS EDUCATION COMMITTEE.—Assistant School Medical Officer. Salary, £350 per annum.

OLDHAM COUNTY BOROUGH.—Assistant Schools Medical Officer. Salary, £325 per annum, rising to £400.

PLYMOUTH: SOUTH DEVON AND EAST CORNWALL HOSPITAL.—House-Physician (male). Salary, £200 per annum.

QUEEN'S HOSPITAL FOR CHILDREN, Hackney Road, E.—Temporary Surgeon in charge of Ear, Nose, and Throat Department. Honorarium, £25 per annum.

ROCHDALE INFIRMARY AND DISPENSARY.—Junior House-Surgeon. Salary, £200 per annum.

SHERBURN HOSPITAL, near Durham.—(1) Medical Officer to Charge of Infirmary and Dispensary. (2) Locumtenent, salary, £9 9s. per week.

UNIVERSITY OF LONDON.—External Examiner in (1) Obstetric Medicine, (2) Pathology, (3) Pharmacy.

WARWICKSHIRE COUNTY COUNCIL.—Temporary Assistant County Medical Officer of Health. Salary, £400 per annum.

WESTMORLAND CONSUMPTION SANATORIUM AND HOME, Meathop.—Second Assistant Medical Officer (male). Salary, £200 to £250 per annum.

WIGAN EDUCATION DEPARTMENT.—Assistant School Medical Officer. Salary, £300 per annum.

To ensure notice in this column—which is compiled from our advertisement columns, where full particulars will be found—it is necessary that advertisements should be received not later than the first post on Wednesday morning. Persons interested should refer also to the Index to Advertisements which follows the Table of Contents in the JOURNAL.

APPOINTMENTS.

ALCOCK, W., L.M.S.S.A., District Medical Officer of the Leekesall Bierlow Union.

ASPLEN, W. R. W., M.B., B.S. Lond., Certifying Factory Surgeon for the Kenilworth District, co. Warwick.

DAVIES, H. W., M.B., District and Workhouse Medical Officer of the Swaffham Union.

GOULDEN, H. E., M.D. Durh., District Medical Officer of the Newton Abbot Union.

SHEPPARD, H. P., M.B., District Medical Officer of the Bodmin Union.

WORTS, C. C., L.S.A., District Medical Officer of the Laxden and Winstrete Union.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 6s., which sum should be forwarded with the notice not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

BIRTH.

NELIGAN.—On February 3rd, at the British Legation, Tehran, Persia, the wife of A. R. Neligan, M.D., of a son.

MARRIAGE.

SMITH—WILLIAMS.—On February 1st, by licence, at the Parish Church, by the Rev. Hiram Rees, Vicar, James Tait Smith, M.A., M.B., Ch.B., second son of Mr. and Mrs. T. Smith, Glasgow, to "Meta," younger daughter of the late J. T. Williams and of Mrs. Williams, Cwmillery House, Cwmillery, Mon.

DEATHS.

HERRING.—On January 27th, 1918, at 109, Earl's Road, Nunneaton, John Francis Herring, L.R.C.P., L.R.C.S. Edin., D.P.H. Cantab., late of St. Mary's House, Atherstone, aged 75.

PETTITT.—On January 15th, 1918, William Brakenridge Pettitt, M.R.C.S., of Long Melford, Suffolk, from injuries sustained in a motor-cycle accident, aged 53 years.

DIARY FOR THE WEEK.

MONDAY.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W.—8.30 p.m., Mr. H. W. Carson: Clinical Aspects of Tuberculous Mesenteric Glands.

FRIDAY.

SOCIETY OF TROPICAL MEDICINE AND HYGIENE, 11, Chandos Street, W.—5.30 p.m., Sir Ronald Ross: Treatment of Malaria.

POST-GRADUATE COURSES AND LECTURES.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.15.

ROYAL SOCIETY OF MEDICINE.—Wednesday, 5.30 p.m., Lecture by Sir Almroth Wright, M.D., F.R.S.: The Methods of Testing and Judging the Divers Forms of Wound Treatment. Thursday, 8.30 p.m., Conjoint meeting of the Sections of Neurology and Surgery with the War Office Committee for the Study of Tetanus: Muscle Contracture Following Injury. Section of Otolaryngology: Friday, 5 p.m., Discussion: The Influence of Disorder of the Nose on the Ear. To be opened by Dr. William Hill.

ROYAL COLLEGE OF SURGEONS, Lincoln's Inn Fields, W.C.—Lectures, 5 p.m.: Monday, Professor H. Carllil: Diagnosis and Treatment of Syphilis of the Central Nervous System. Wednesday and Friday, Professor W. Wright: Quaderini d'Anatomia by Leonardo da Vinci.

CURRENT NOTES.

The Education Bill.

ON December 14th, 1917, a deputation from the British Medical Association waited on the President of the Board of Education to urge that the scope of Clauses 18 and 19 of the Education Bill should be limited to medical inspection, the proposed extension of the power to provide medical treatment being excluded from them.¹ As a result of this deputation it was hoped that the suggestion of the Association would be carried into effect, especially in view of the fact that the bill had been withdrawn on the understanding that a new bill would be at once introduced. At the Council meeting on January 23rd it was reported that the bill had been reintroduced in an amended form as regards some of its clauses, but that Clauses 18 and 19 were unaltered. After discussion, the Council recorded its opinion that Clause 18 of the Education Bill ought to be deleted, and authorized the Medico-Political Committee to take appropriate action in support of this decision. Discretion was given to the Committee, should it not be found feasible to obtain the omission of the whole of the clause, to revert to the former policy of pressing for amendment of the clause by leaving out power to provide medical treatment.

Payment of Medical Officers of Auxiliary Hospitals.

SINCE the last Representative Meeting, when this matter was very fully debated, many inquiries as to the payment of medical officers of auxiliary hospitals have been addressed to the Central Medical War Committee; it appeared that the methods and the amount of remuneration varied considerably in different areas. When the question was raised with the War Office, the Committee received the reply that it was proposed to issue a circular dealing comprehensively with the subject; but, in spite of several reminders by the Committee, the circular has not been issued. The Committee, therefore, in its quarterly report to the Council of the Association, had to express its regret that, in spite of repeated representations to the War Office, and obvious dissatisfaction in many parts of the country, the authorities have not yet dealt firmly and finally with this matter. At its last meeting, on January 30th, the Committee decided to press upon the authorities the desirability of settling the question by the payment of a uniform sum of 10s. a day, in the same form and manner as obtain in the Aldershot Command.

Inquiry into the Composition of the Central Insurance Pool.

AT the Conference of Local Medical and Panel Committees held in October last, when the subject of the inquiry into the composition of the Central Medical Benefit Pool was being discussed, representatives of several Committees said they had no doubt their Committees would be glad to subscribe to the cost of this inquiry. No application has yet been made to the Panel Committees on the subject, but

¹ SUPPLEMENT, January 19th, 1918, p. 9. See also SUPPLEMENT, November 3rd, 1917, p. 91.

the following Committees have already spontaneously forwarded subscriptions to be applied to this purpose: Gloucestershire, Essex, and Staffordshire. The Staffordshire Committee forwarded its subscription "as a mark of its appreciation of the work of the Insurance Acts Committee."

Association Notices.

ANNUAL REPRESENTATIVE MEETING, 1918.

THE Annual Representative Meeting of the Association, 1918, will be held in London on Thursday, July 25th, 1918, and following day(s) as may be required.

Notices of Motion from Divisions and Branches for the consideration of the Annual Representative Meeting, proposing to make any addition to or any amendment, alteration, or repeal of any Regulation or By-law, or to make any new Regulation or By-law, or proposing material alteration of the policy of the Association in matters relating to the honour and interests of the medical profession or of the Association (Article 30, By-law 40), must be published in the BRITISH MEDICAL JOURNAL not later than the issue of May 25th, and for this purpose should be received by me not later than May 16th, 1918.

By order,

ALFRED COX,

Medical Secretary.

January 28th, 1918.

Meetings of Branches and Divisions.

LANCASHIRE AND CHESHIRE BRANCH: MID-CHESHIRE DIVISION.

THE following officers have been elected for 1918:

Chairman: Dr. W. C. Reushaw. *Vice-Chairman:* Dr. H. G. Cooper. *Representative in Representative Meetings:* Dr. T. W. H. Garstang. *Deputy Representative:* A. T. Blease. *Representatives on Branch Council:* Drs. H. A. Burrows, A. T. Blease. *Secretaries:* A. T. Blease and P. R. Cooper.

THE ORGANIZATION OF THE PROFESSION AND RURAL PANEL PRACTITIONERS.

SIR,—The correspondence in recent numbers of the SUPPLEMENT shows that rural practitioners are at last becoming alive to their grievances, or rather that they are beginning to give them adequate expression.

It seems to have been a fixed idea among the Insurance Commissioners that, owing to the lower sickness incidence, the country doctor would have less work in proportion than his brother in the town. Experience has completely knocked the bottom out of this fallacy. The sickness incidence may be less, but it must be remembered that the town doctor sees probably 60 to 70 per cent. of his patients in his surgery, the country doctor probably 30 to 40 per cent. The insured person does not relish the idea of walking a distance to see his doctor when he considers that it is his right to send for him.

There are few country doctors who have not had the experience of going five or six miles into the country

to find his patient going about or even at his work. Employers, too, are quite alive to the advantages of the situation. A ploughman, perhaps, is off work for a day through a cold. His employer will tell him that if he is unfit for his work he must call in his panel doctor, especially as it costs nothing.

It is not only the country doctors who realize the injustice of their position. In his admirable pamphlet on "Medical Benefit in Scotland" the clerk to the Insurance Committee of the County of Lanark expresses his opinion with no uncertain voice and shows by statistics how fallacious is the argument that the country doctor has less to do in proportion to his panel than the town man.

It is to be hoped that the Insurance Committees will show a better appreciation of the position than they have done in the past. Dr. Brackenbury's statement is little more than a confession of ignorance. Country doctors may have been inarticulate, but it must be remembered that in few instances can they afford the time to attend meetings and conferences, and when they do they have little chance of a hearing.

The Rural Practitioners Subcommittee does not appear to be doing much. The member for Scotland, the late Dr. Grant, of Blantyre, though a most excellent man, could not in any sense be termed a rural practitioner. His practice was in a large mining village on the outskirts of a considerable town.

The country doctor must realize that the time has come to make a fight for his position, and if the Insurance Acts Committee will not or cannot look after his interests an independent organization must be formed.

I, for one, would regret anything in the nature of a split in the Association, but the members must recognize the rights of every class in the profession to fair treatment.—I am, etc.,

Thornhill, Dumfriesshire,
Jan. 28th.

M. BRYSON,
Secretary, Panel Committee,
Dumfriesshire.

SIR,—I should like to comment upon Dr. Baigent's letter (SUPPLEMENT, January 12th) from the townsman's point of view.

The case for better treatment of the rural panel practitioner is overwhelming, and it seems to me that differences of opinion can only arise in connexion with the method of securing the remedy.

There are statements in Dr. Baigent's letter with which I cannot agree. He says, for instance:

When the Insurance Bill was first considered and the capitation fee arranged . . . I believe the original intention was to divide the capitation grant in such a way that rural practitioners would receive payment on a higher scale than the town doctor.

So far as it refers to the *capitation grant*, I challenge that statement. I had occasion to follow closely the Insurance Bill during its passage through Parliament, and I have not before been aware of any suggestion that the capitation fees should be divided unequally between town and country practitioners.

As I understand the matter, any extra allowance to rural practitioners was to be made from a special fund (the mileage fund) which was to be set up quite independently of the capitation grant, and, so far as I know, it was never intended that deductions should be made from the capitation fee of the townsman, to be added to the capitation fee of the country practitioner.

It is necessary to keep clearly in view how the remuneration of the panel practitioner is made up; disregarding extras, such as temporary residents, we have:

1. *The capitation fee*, which was a flat rate of (as we supposed) 6s. 6d. a head, and was accepted, more or less willingly, by all classes of practitioners, town and country alike, as payment for all ordinary services, which, under agreement, could properly be demanded from the average practitioner, for insured persons who reside within a limited distance of the practitioner's residence (in my agreement the distance is two miles). It is intended to cover all expenses incurred in attending insured persons, including locomotion, within the limited distance, as well as remuneration for services rendered. The nature and extent of these services must, of course, vary according to the practice, and this applies not only to town and country, but also to colliery, industrial, and health resort panel practice.

2. *The mileage allowance* is a separate and distinct fund, and has no connexion with capitation fees. As Dr. Baigent says, in rural practice the distances are longer, expenditure of time per visit greater, working expenses higher, and work harder. These special conditions of hardship peculiar to country practice only arise, of course, in attending persons who live beyond the distance covered by the capitation fee, and the mileage allowance was created for the particular purpose of remunerating practitioners for these specially arduous conditions, and it is the only fund which can properly be called upon to meet these conditions.

3. *The Drug Fund* is for the purpose of providing drugs and appliances either through practitioners or chemists. It has no connexion with capitation fee or mileage allowance.

These three funds are therefore entirely separate, and each for a specific purpose, and I submit if the Drug Fund is inadequate to cover the increased cost of drugs, this is no reason for pilfering part of the capitation fee, but it is a very pertinent reason for increasing the Drug Fund.

Similarly, if the mileage allowance is inadequate, and I am sure it has been grossly so, this also is no justification for annexing part of the capitation fee, but it is a proper and potent reason for adjusting the mileage fees.

In my opinion, the only satisfactory solution for the rural practitioner is that he should have a sufficient and fixed payment per mile travelled, which should fairly cover time as well as outlay involved in transit.

I am sure Dr. Baigent would receive general support in this, as I am sure he will receive opposition if, as he suggests, he proposes to take away from the townsman part of his properly and hard-earned capitation fee to supplement an inadequate mileage fund.—I am, etc.,

Thornaby-on-Tees, Feb. 2nd.

W. MURRAY.

INSURANCE.

NATIONAL INSURANCE, 1914-17.

THE Report on the Administration of National Health Insurance during the years 1914-17 recently presented to Parliament is divided into parts describing the work of the Joint Committee and the four countries separately. Practically all the questions dealt with of interest to the medical profession have been noticed in the *BRITISH MEDICAL JOURNAL* as they arose, and a general notice of the report, and a special notice so far as it relates to Ireland, has already been given, and it is now further proposed to refer to the parts that relate to England, leaving Scotland and Wales to a subsequent notice. In connexion with the work of the Joint Committee, the establishment of the new Advisory Committee of 48 members in place of the old committee of 168 members is recorded. Actuarial questions affecting the approved societies are dealt with at length, and it appears that, taking England alone, the amounts paid for sickness and maternity benefits have fallen considerably from 1914, but the Commissioners believe that the high rates of sickness benefit during the earlier years were not normal, but due to some extent, specially in the case of women, to inexperienced supervision of claims. On the other hand, disablement benefit has increased more than five-fold since 1914, and further increase may naturally be expected for some years until it attains its normal.

The financial provisions of the Acts as they affect soldiers and sailors and the position of the Navy and Army Fund are explained in detail, but nothing of importance is added to what has appeared in the *JOURNAL*. On July 1st, 1917, the number of discharged men entitled to benefits out of the Navy and Army Fund was 22,468, and the number of men notified for tuberculosis by the naval and military hospitals was 8,420. To compensate Insurance Committees for the additional cost of dealing with these cases additional funds have been voted by Parliament, and the arrangements made to secure co-ordination between insurance and pensions authorities in the provision of treatment for disabled men are fully described. Among the other activities of the Commission in connexion with the war is that of securing a continuance of an adequate medical and pharmaceutical service for the civil population in view of the number of doctors and pharmacists required for the forces, and work done in co-operation with the Central Medical War Committee is described.

In certain places it has been necessary to make special arrangements for the treatment of persons engaged in the construction of War Office camps and munition works, and something like 12,000 persons have been treated under these arrangements. Under the scheme for the provision of free medical service to the dependants of serving sailors and soldiers, which came to an end in August, 1916, when the War Pensions Statutory Committee was formed, about 400,000 medical books were issued and payment was made for about 1½ million prescriptions. About 12,000 doctors and 6,500 chemists volunteered their services under the scheme.

The effect of the war in imposing increased work on the lessened staffs of approved societies is dealt with at length, and it is stated that the total contributions of societies towards the financing of the war by investment in War Securities of moneys arising through National Health sources is about £7,000,000, apart from the sums invested in these securities by the National Debt Commissioners on behalf of the Commission. The number of approved societies operating in England in 1916 was 1,475, but in the public interest the membership is only given for the beginning of the war, when it was 10,874,079.

An abstract of cash receipts and issues out of the National Insurance fund is given for 1915 and 1916, and it appears that the total receipts in 1915 were £20,438,129, and in 1916, £19,016,790. In the latter year the amount received from the sale of stamps was rather over £13,500,000, and the Exchequer grants were £3,744,000. The amount paid out to societies for benefits and administration was about £7,024,000, and to Insurance Committees for medical and sanatorium benefits and administration £4,975,529, while about £5,320,000 was handed over to the National Debt Commissioners for temporary investment.

(To be continued.)

THE INCREASED MILEAGE GRANT.

THE clerk of the Insurance Acts Subcommittee (Scotland) of the British Medical Association has forwarded a copy of a letter issued by the Scottish Insurance Commissioners to the clerks of Insurance Committees in Scotland, dealing with the extra mileage grant on account of war conditions. This letter closely resembles that issued by the English Insurance Commission on January 21st, and reproduced in the SUPPLEMENT of January 26th. As in the case of England, application forms must be forwarded not later than February 21st.

CURRENT NOTES.

The Demand for an Increased Insurance Capitation Fee.
On February 19th the Insurance Acts Committee had an interview with the Insurance Commissioners, when Sir Edwin Cornwall, M.P., Chairman of the Joint Committee of Insurance Commissioners, read a communication containing his reply to the demand for an increased capitation fee put forward by the Conference of Local Medical and Panel Committees on October 18th, 1917. The decision contained in this document amounts to a refusal to grant any general increase in the capitation rate for insurance practitioners.

Immediately after the interview the Insurance Acts Committee held a meeting, when it was decided to call a conference of representatives of Local Medical and Panel Committees for some day in the second week of April. In the meantime the Executive Subcommittee has been instructed to prepare a reasoned reply to Sir Edwin Cornwall's communication.

Economy of Medical Man Power in the Army.

The Central Medical War Committee, at its meeting on February 20th, considered the question of the medical man power of the country in relation to the needs of the services and of the civil population. A resolution to the following effect was passed:

That the attention of the Ministry of National Service be drawn to the hardships already inflicted upon the civil community and upon individual members of the civil medical profession in providing medical officers for service with the army; and to the additional hardships which would be inflicted by any further reduction in the numbers of civilian medical practitioners. The Committee therefore requests the Government to consider whether it would not be possible by a revision of the duties of medical officers serving with the Forces to meet further requirements without any additional call on the medical profession available for the civil community.

Medical Services of the Home Forces.

The Chairman of the Central Medical War Committee at the same meeting read a communication addressed to him by instruction of the Field-Marshal Commanding-in-Chief, Home Forces (Viscount French), stating that Temporary Colonel John Atkins, C.M.G., A.M.S., had been appointed Deputy Director of Medical Services, Home Forces, on February 6th, and that one of his duties was the organization for service with Home Forces of those medical men (including Volunteers and Emergency Corps) who are not serving with the regular forces. In order to bring about the most effective co-operation between the representatives of the civil medical profession and the Medical Department of Home Forces, the Field-Marshal desired that Colonel Atkins should attend the meetings of the Central Medical

War Committee. The Chairman expressed his intention of replying to the effect that the Committee will be pleased to regularize Colonel Atkins's position.

PROCEEDINGS OF COUNCIL.

A MEETING of the Council was held at 429, Strand, W.C., on January 23rd, 1918, when there were present:

Dr. J. A. Macdonald, Chairman of Council, in the chair; Sir T. Clifford Allbutt, President; Mr. E. B. Turner, Chairman of Representative Meetings; Dr. G. E. Haslip, Treasurer; Dr. M. G. Biggs, Lieut.-Colonel R. A. Bolam, Dr. H. B. Brackenbury, Dr. H. J. Campbell, Dr. Francis Clark, Major Russell Coombe, Lieut.-Colonel R. H. Elliot, I.M.S., Major E. Rowland Pothergill, Sir James Galloway, K.B.E., C.B., Dr. T. W. H. Garstang, Dr. John Goff, Mr. N. Bishop Harman, Lieut.-Colonel W. T. Hayward, C.M.G., LL.D., Dr. R. Langdon-Down, Major Albert Lucas, Dr. H. C. Mactier, Lieut.-Colonel J. Munro Moir, Dr. E. N. Nason, Major George Parker, Dr. C. E. Robertson, Dr. F. J. Smith, Dr. W. Johnson Smyth, Dr. John Stevens, Dr. W. B. Crawford Treasure, Dr. T. Jenner Verrall, Dr. Claude Wilson, and Dr. O. R. M. Wood.

The following were unavoidably prevented from attending:

Dr. J. Adams, Sir James Barr, Dr. E. J. Domville, Dr. A. Fulton, Major Farquharson, Dr. J. J. Giusani, Dr. James Green, Dr. T. Duncan Greenlees, Fleet Surgeon F. D. Lumley, R.N., Colonel C. H. Milburn, Dr. Noy Scott, and Major C. S. Young.

The CHAIRMAN welcomed Dr. John Goff, of Bothwell, to the vacancy created by the resignation of Major J. Livingstone London, and the Council congratulated Sir James Galloway and Sir James Cantlie on the honours recently conferred upon them.

Lieut.-Colonel HAYWARD intimated that he would shortly be returning to Australia, and desired to thank all those members of the Association with whom he had come into contact during his stay in England for the courtesy with which he had always been received.

The CHAIRMAN, on behalf of the Council, expressed to Lieut.-Colonel Hayward appreciation of the assistance given by him in dealing with the various questions affecting Oversea Branches.

Mr. W. E. Hempson was reappointed for one year Solicitor to the Association.

FINANCE COMMITTEE.

The grant of £50 to the Scottish Medical Service Emergency Committee was approved.

The Treasurer was empowered to make the Scottish Committee a preliminary grant of £100 towards the expenses of the current year.

Instructions were given that an announcement be made in the BRITISH MEDICAL JOURNAL, on the authority of the Council, drawing the attention of members to the fact that from the first issue in March the number of pages of the JOURNAL must be still further reduced by one-third, and particularly to the following points:

(1) That this reduction is not a matter of choice with the Council, but compulsory under the Defence of the Realm Regulations; and

(2) That, as in the case of other rationed articles, there is no guarantee that a sufficient supply of paper or paper-making materials will be available in the country to furnish to each consumer the proportionate minimum quantity permitted under the amended regulations.

The accounts for the quarter ending December 31st, 1917, amounting to £13,761 7s. 9d., were approved, and the Treasurer empowered to pay those remaining unpaid.

JOURNAL COMMITTEE.

It was agreed that, in the interests of the Association and the JOURNAL, it is essential that the weekly publication of the BRITISH MEDICAL JOURNAL be not interfered with. When the supplies of paper available for 1918 are insufficient the mottled grey cover will be abandoned for the time being.

ORGANIZATION COMMITTEE.

It was decided that the grants for 1918 to the Oversea Branches be as in previous years.

It was decided to draw the attention of the Divisions and Branches, Home and Oversea, through the medium of the BRITISH MEDICAL JOURNAL, (1) to the action already taken by the Council and Representative Body as to representation of the medical profession on public bodies; and (2) to the special importance at the present time of adequate medical representation upon Government and municipal bodies, in view of the reconstruction proposals known or likely to be in contemplation throughout the empire.

The Annual Representative Meeting, 1918, will be held in London, commencing on the morning of Thursday, July 25th. The Annual General Meeting will be held on the afternoon of Friday, July 26th.

MEDICO-POLITICAL COMMITTEE.

The Committee reported (a) that since the approval by the Council, at its meeting on October 24th, 1917, of the action of the Committee in circulating to Divisions and Branches, to members of Parliament, and Government departments concerned, the memorandum appended to the last quarterly report urging that the scope of the clauses 18 and 19 of the Education Bill be limited to medical inspection only and not treatment, representatives of the Committee had met the Minister of Education and urged that policy upon him, as a result of which it had been hoped that the wishes of the Association would be met, in the amended form of the bill which was to be introduced in the present session; (b) that the bill had been reintroduced in an amended form as regards some of its clauses but with clauses 18 and 19 unaltered; and (c) that it was now for the Council to consider what further action should be taken in the matter. The Council came to the conclusion that clause 18 of the Education Bill should be deleted, and authorized the Medico-Political Committee to take what action it might deem desirable in support of such decision.

INSURANCE ACTS COMMITTEE.

The Chairman of the Committee drew attention to the possible necessity for the Committee calling a conference of representatives of Local Medical and Panel Committees before the next meeting of the Council, in connexion with the answer of the Government to the request for an increased capitation fee. The Council authorized such a conference, if necessary.

HOSPITALS COMMITTEE.

The Hospitals Committee was authorized to issue the memorandum drawn up by representatives of the London hospitals and the British Hospitals Association, concerning the payment of medical practitioners for the treatment of discharged disabled soldiers and sailors at voluntary hospitals, to the medical staffs of voluntary hospitals throughout the country, recommending its acceptance, together with a covering letter drawing attention to certain points.

CENTRAL MEDICAL WAR COMMITTEE.

It was decided to make representations to the Minister of National Service stating that the Council considers it to

be of great importance from the National Service point of view that the report of the committee appointed by the War Office in the previous autumn to inquire into the use of medical officers in the army should be published without delay.

MINISTRY OF HEALTH COMMITTEE.

The Council considered and approved the amended scheme for a Ministry of Health and directed that, in accordance with Minute 114 of the Annual Representative Meeting, 1917, it be at once submitted to the Government, accompanied by a letter emphasizing certain points to which the Council attached special importance. The scheme and the correspondence will be reported later to the Divisions and Representative Body.

Candidates for Election to the Association.

Sixty-two candidates were elected Members of the British Medical Association.

Association Notices.

ELECTION OF MEMBERS OF COUNCIL, 1918-19, BY BRANCHES NOT IN THE UNITED KINGDOM.

THE following nominations have been received from the undermentioned grouped Branches (By-law 49):

Lieut.-Colonel H. SIMPSON NEWLAND, M.B., F.R.C.S., D.S.O. (Queen Mary's Hospital, Sidcup), for the South Australian, Tasmanian, Victorian, Western Australian grouped Branches.

Lieut.-Colonel ROBERT H. ELLIOT, M.D., F.R.C.S., J.M.S. retd. (54, Welbeck Street, London, W.), for the Assam, Baluchistan, Bombay, Burma, Ceylon, Hyderabad and Central Provinces, Punjab, and South Indian and Madras grouped Branches.

Lieut.-Colonel EDWARD NEWBURY THORNTON, M.R.C.S., L.R.C.P. (S. African Hospital, Richmond, Surrey), for the Border (S. Africa), Cape of Good Hope (Eastern and Western), East Africa and Uganda, Egyptian, Gibraltar, Griqualand West, Malta and Mediterranean, Natal Coastal, Natal Inland, Orange Free State, Pretoria, Rhodesian, and Witwatersrand grouped Branches.

No other nominations having been received, the said Lieut.-Colonel Newland, Lieut.-Colonel Elliot, and Lieut.-Colonel Thornton are hereby duly elected as Members of the 1918-19 Council.

By order of the Council,

GUY ELLISTON,
Financial Secretary and Business Manager.

February 23rd, 1918.

Meetings of Branches and Divisions.

EAST YORK AND NORTH LINCOLN BRANCH: NORTH LINCOLN DIVISION.

THE following officers have been elected for the ensuing year:

Chairman: Dr. Grierson. Vice-Chairmen: Dr. Felton and Dr. Wallace. Secretary: Dr. Williamson. Representatives on Branch Council: Drs. Grierson and Swindells. Representative on Hospital Committee: Dr. G. O. McKane. Representative in Representative Meeting: Dr. Rotherham; Deputy, Dr. Swindells.

INDIAN MEDICAL SERVICE.

ITS PRESENT POSITION AND THE REFORMS NECESSARY.

As there seems to be some misapprehension in the matter, it seems desirable to point out that the recent action of the British Medical Association with regard to the present position and future prospects of the Indian Medical Service is comprised in the following documents:

1. The statement submitted to the Secretary of State for India at his request on the present position and future prospects of the Indian Medical Service, dated October 30th, 1913. It is a long and reasoned statement, which has now been before the profession at home and in India for four years.
2. A memorandum on that part of the report of the Royal Commission on the Public Services in India which deals with the Indian Medical Service, forming Appendix XI to the Supplementary Report of the Council of the British Medical Association for 1917; published in the SUPPLEMENT to the JOURNAL of July 7th, p. 8-9.
3. The memorandum on the present position of the Indian Medical Service and the reforms necessary: a condensed statement and recapitulation forwarded to the Secretary of State in anticipation of the deputation which is to meet him on his return from India.

We have received a letter from Temporary Lieutenant A. Krishna Menon, I.M.S., in the course of which he writes:

The Association's suggestions ignore the demand put forward by the Moderates among Indian public men for at least simultaneous examinations in India and England for recruitment to the public services, and, though unwittingly, casts an aspersion on one section of teachers of medical subjects—namely, teachers of midwifery and gynaecology, among whom India has had the services of some first-rate men. One cannot say that there is any difference in results as far as teaching is concerned of these or other subjects; and if there is, as the Association assures us, it is not due to any difference in the capacity of the teachers nor the ineptitude of the Indian student—for the Association thinks that a course in a British school of medicine will set them all right—nor for lack of clinical material in the women and children's hospitals attached to the various medical colleges. I hold that even better results than what are obtained can be secured by increasing the number of medical colleges in India, so that teachers will be better able to devote individual attention to their students. The essential difference, so far as teaching of midwifery and gynaecology and of other subjects goes, is that there always are more than one clinical teacher for the other subjects, whereas in midwifery and gynaecology this is very seldom obtained.

Still further improvement may be effected by the institution of a special educational service for medicine, engineering, etc. The pay should be high enough to attract the best men in their subjects from all over the world, and certainly where qualifications are equal, Indians and members of the Indian Medical Service ought to be given preference. This will also ensure continuity of tenure in teaching individual subjects, which is not sufficiently recognized now.

The same remarks apply to the specialist branches like bacteriology, ophthalmology, etc.

If these suggestions are given effect to, the question of increase of pay and emoluments to members of Indian Medical Service need not arise, for there will be a sufficiently large number of properly qualified Indians to select candidates from for the Indian Medical Service with the present rates of pay. And, after all, that is what is to be aimed at—namely, to train the Indians and enable them to serve their country, as far as they can, to supplement it and give them the lead wherever necessary.

The Association does not seem to have paid adequate thought to the practicability of giving the necessary facilities for training in British medical schools and hospitals to even a small fraction of the large number of medical men that is needed to cater for the population of India, nor to the religious and financial difficulties of all except a very small number of Indians to prosecute or supplement their studies in Europe. Will it not be more sensible to give them the required facilities for education in their own country than to transport them long distances for the same? Of course, it will be an excellent thing to encourage and afford facilities for post-collegiate studies to Indians in Europe or America as far as possible. But that should not be done at the risk of leaving Indian institutions inefficient.

WAR EMERGENCY FUND OF THE ROYAL MEDICAL BENEVOLENT FUND.

THE following further subscriptions have been received from Divisions of the British Medical Association in response to the recent appeal, and have been passed on to the Treasurer of the War Emergency Fund. The names of individual subscribers are published monthly in the advertisement pages of the JOURNAL:

	£	s.	d.
Torquay Division, per Dr. G. Young Eales, Hon. Sec.	...	2	2
Dudley Division, per Dr. L. A. Taylor, Hon. Sec.	...	56	11
Leeds Division, per Dr. J. Allan, Hon. Sec.	...	1	11

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are announced by the Admiralty: Surgeon M. J. Aitken to the *Foreright*. Temporary Surgeons: G. H. C. SIG Griffiths, to Haslar Hospital; J. A. McVae, to Ascension Hospital; C. W. Bowen, to the *Seagull*; P. V. Wynn-Warwick, to Chatham Hospital; T. C. Brentnall, to Plymouth Hospital. To be temporary Surgeon: H. C. Apperly.

ROYAL NAVAL VOLUNTEER RESERVE.

Surgeon Probationer G. F. S. Parker to the *Defender*. To be Surgeon Probationers: G. C. W. Curson, R. E. Ford, G. R. Woodhead, H. E. Emmett, J. E. Fishburn.

ARMY MEDICAL SERVICE.

Colonels to be Surgeon-Generals: J. J. Gerrard, C.B., F. R. Newland, C.M.G., J. J. Russell, C.B.

To be temporary Colonels: Lieut.-Colonels J. S. Gallie, D.S.O., whilst employed as Deputy Director of Medical Services, Lines of Communication; J. A. Hartigan, D.S.O., and H. G. Martin, whilst employed as Assistant Directors of Medical Services of a Division; and J. Sherren.

ROYAL ARMY MEDICAL CORPS.

Lieutenant-Colonel H. S. Koch, D.S.O., to be temporary Colonel whilst employed as Assistant Director of Medical Services of a Division.

Temporary Lieut.-Colonel H. W. Bruce, from the Southwark Military Hospital, to be temporary Major on reposting.

Majors relinquish the acting rank of Lieut. Colonel on reposting: J. H. Brunskill, D.S.O., G. H. J. Brown, D.S.O., B. H. V. Dunbar, D.S.O.

Major A. E. S. Irvine, D.S.O., retains the acting rank of Lieut.-Colonel whilst in command of a medical unit.

To be acting Lieut.-Colonels whilst in command of a medical unit: Majors J. C. G. Carmichael, F. M. Parry, C. G. Browne, D.S.O., Captains E. D. Caddell, M.C., F. A. MacCammon, M.C., C. Helm, M.C., F. Casement, D.S.O., J. G. Gill, M.C.

The undermentioned retain the acting rank of Lieut.-Colonel while commanding a medical unit: Major E. B. Knox, temporary Captain R. E. Drake-Brockman.

Major E. L. Moss, M.C., retains the acting rank of Lieut.-Colonel whilst specially employed.

To be temporary Lieut.-Colonels: Major J. F. Martin, C.M.G. (whilst employed as Assistant Director of Medical Services), temporary Majors S. C. Elgee (whilst employed at the Manor—County of London—War Hospital), H. French; temporary Captain R. J. Rowlette.

Major P. J. Marett to be acting Lieut.-Colonel whilst in command of a medical unit, September 9th, 1917 (substituted for notification in the *London Gazette* of December 6th, 1917).

Temporary Major (Captain R.A.M.C.T.F.) R. A. Fleming relinquishes his temporary commission.

Temporary honorary Major G. Dreyer to be temporary honorary Lieut.-Colonel.

The undermentioned are granted temporary rank:—As Lieut.-Colonel: G. J. Johnston. As Major: Sir C. A. K. Ball, Bt., L. Kidd. As Captain: A. E. Boyd.

Temporary Captains to be temporary Majors: R. T. Smith, G. F. B. Simpson.

Temporary honorary Captain E. H. Hicks to be temporary honorary Major whilst serving with British Red Cross Society in France.

Temporary honorary Captain M. W. Flack to be temporary honorary Major.

The notification in the *London Gazette* of January 16th regarding temporary Captain J. P. O'Connor is cancelled.

Temporary Captains relinquish their commissions on appointment under the Ministry of National Service: T. W. Shaw, W. R. Knightley, A. B. Jones.

Officers relinquish their commissions: Temporary Captains W. J. Weaver (December 15th, 1917; substituted for notification in the *London Gazette*, January 8th, 1918), W. G. S. Neely, J. F. Adamson, W. G. Ridway, M. McNiff (on account of ill health caused by wounds), E. B. Israel, C. H. Treadgold, D. M. MacMannus, J. L. R. Philip (on transfer to I.M.S.), Temporary honorary Captain J. R. Taylor. Temporary Lieutenants T. B. Smith, G. Chalmers, D. H. Groom. Temporary honorary Lieutenants C. K. Valade, J. F. Harvey, R. G. Carothers, L. T. Kewer, J. H. Dorman, W. L. Hanson, J. R. Tippins.

To be temporary Captains: W. Farrer Thompson (whilst employed at County of Middlesex War Hospital, R. M. Broute. Temporary Lieutenants R. Semple, J. Campbell, C. A. Hughes, P. K. Muspratt, J. Wyper, A. M. Roberts.

Lieutenant T. J. McDonald relinquishes his commission on account of ill health and is granted the honorary rank of Lieutenant, January 6th, 1918 (substituted for notification in the *London Gazette* of January 5th, 1918).

L. W. Oliver, late temporary Lieutenant, is granted the honorary rank of Lieutenant.

Temporary honorary Lieutenant H. P. Thompson, of St. John Ambulance Brigade Hospital, to be temporary honorary Captain.

Officers relinquish their commissions on account of ill health contracted on active service:—Temporary Captains: F. W. Martin, F. L. Keith; temporary Lieutenant E. A. Edington.

Temporary Lieutenants C. M. Ormsby and A. W. Hall relinquish their commissions on account of ill health.

Lieutenants (temporary Captains) to be Captains: E. Davies, R. E. Barnesley, M.C., T. J. Kelly, M.C., R. J. Clausen, M.C., C. McN. McCormack, M.C., G. D. Jameson, D. W. Pailthorpe, St. J. D. Buxton, E. F. W. Grellier, S. Arnott, T. L. Fraser, L. G. Bourdillon, D.S.O., M.C., (Acting Lieut.-Colonel) R. A. Preston, M.C., A. B. Preston, J. Sainsbury, G. D. Robertson, H. D. F. Brand, R. Ellis, M.C., F. G. A. Smyth, J. P. Little, C. J. O'Reilly, M.C., W. Foot, M.C., F. C. K. Austie, D. C. Monro.

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Lieutenant E. Chapelle relinquishes his commission on account of ill health.

The following from the contingents O.T.C. of the universities indicated to be Lieutenants: W. A. Fraser (St. Andrews), I. Liberman (Leeds), W. O. Holst, M. O. Simpson, and J. F. Twort (London), W. M. Kerr and W. H. Wallace (Glasgow), A. H. Morris (Bristol), C. F. J. Carruthers (Manchester).

To be Lieutenants: D. F. Panton, T. G. James, Second Lieutenant (honorary Lieutenant) W. G. F. Owen-Morris from T.F.R., Second Lieutenant S. Kiddough from Unattached List T.F.

GENERAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Majors to be Lieut.-Colonels: G. S. Maosfield and Brevet Lieut.-Colonels C. E. P. Fowler and H. A. Berryman. Captain A. F. Heaton to be Major.

OVERSEAS CONTINGENTS.

CANADIAN ARMY MEDICAL SERVICE.

Temporary Major C. F. C. Hazard from Canadian Light Horse to be temporary Major (substituted for notification in the *London Gazette* of December 14th, 1917, incorrectly describing name as Hazard).

To be temporary Majors: Temporary Captains W. L. Shannon, F. G. Logie, J. C. Wickham, A. T. Henderson, A. H. Pirie, C. A. McDiarmid, R. B. Robertson, C. F. Boyer, L. M. Rice, J. H. McPhedran. Temporary Captains (acting Majors) J. W. Hutchinson, H. C. Burgess, W. H. Lowry.

Temporary Captains to be acting Majors: R. J. Gardiner, G. W. Hall, H. W. McGill, M. C. W. H. Scott, M.C., A. B. Chapman, M.C.

Temporary Captain E. J. Leary resigns his commission. To be temporary Captains: S. E. Beech, G. B. Wiswell, temporary Major A. Stirling from New Brunswick Regiment temporary Lieutenants D. R. Finlayson, D. S. McCurdy.

Temporary Lieutenant K. McK. Shorey to be temporary Captain, November 22nd, 1917 (substituted for notification in *London Gazette* of January 18th, 1918, incorrectly describing name as Shoreley).

SOUTH AFRICAN MEDICAL CORPS

Captain F. P. G. de Smidt relinquishes his commission on account of ill health.

TERRITORIAL FORCE.

ARMY MEDICAL SERVICE.

Lieut.-Colonel W. R. Matthews, D.S.O., and Major (temporary Lieut.-Colonel) D. Rorie, D.S.O., Field Ambulance, to be Assistant Directors of Medical Services, and to be temporary Colonel while so employed.

Lieutenant-Colonel C. T. Green, to be Assistant Director of Medical Services, and is granted the temporary rank of Colonel whilst so employed, January 15th, 1915 (substituted for notification in the *London Gazette* of January 14th, 1915).

ROYAL ARMY MEDICAL CORPS.

Lieutenant-Colonel J. S. White is transferred to the permanent personnel, December 26th, 1917.

Major W. F. McAllister-Hewlings, from Deputy Assistant Director of Medical Services, to be Major.

Major J. D. Connie and Captain H. A. B. Whitelocke are seconded. Captain (Brevet Major) D. W. Boswell to be acting Lieutenant-Colonel whilst commanding a field ambulance.

Captain (acting Lieutenant-Colonel) A. Leggat, D.S.O., relinquishes his active rank on ceasing to command a field ambulance.

Captain F. C. Bentz resigns his commission on account of ill health contracted on active service, and is granted the honorary rank of Captain.

Captain S. J. Clegg is seconded whilst holding an appointment as Deputy Assistant Director of Medical Services.

Captains C. W. Sharpley and C. N. Chadborn are restored to the establishment.

Captain C. L. Isaac to be Major.

Captains G. E. Trotter and W. D. Frazer resign their commissions on account of ill health, and are granted the honorary rank of Captain.

Temporary Second Lieutenant T. Edwards, from Labour Corps, to be Lieutenant.

TERRITORIAL FORCE RESERVE.

Colonel C. E. Harrison, C.M.G., C.V.O., from A.M.S., to be Colonel, December 26th, 1917 (substituted for notification in the *London Gazette* of December 25th, 1917).

Lieut.-Colonel J. Young, M.D., from a field ambulance, to be Lieut.-Colonel.

To be Majors: Majors J. C. S. Burditt and F. A. Hadley, from a field ambulance, and A. M. Gossage, from a general hospital. To be Captains: Captains H. D. Levick, from a clearing station; A. G. Osborn, from attached R.A.M.C.; H. J. Preheli and C. Killick, from a field ambulance; Captain J. M. McQueen from R.A.M.C.

VOLUNTEER FORCE.

Cheshire Volunteer Regiment—3rd Battalion.—M. Young to be Medical Officer and temporary Lieutenant, March 29th, 1917 (substituted for notice in the *London Gazette*, May 15th, 1917).

Lincolnshire Medical Volunteer Corps.—J. Williamson (late Lieutenant 3rd Battalion, Lincolnshire V.R.), to be temporary Lieutenant.

Lincolnshire Volunteer Regiment.—H. T. Benson to be Medical Officer and temporary Lieutenant.

Mid-Vessex Motor Volunteer Corps—Western Group.—R. W. Starkie to be Medical Officer and temporary Lieutenant.

West Riding Medical Volunteer Corps.—Medical Officer and temporary Captain A. G. Reid (from 15th Battalion West Riding V.R.), to be temporary Major. W. H. Helm to be temporary Captain.

West Riding Volunteer Regiment—5th Battalion.—J. Barclay to be Medical Officer and temporary Lieutenant.

CURRENT NOTES.

The Demand for an Increased Insurance Capitation Fee.

THE Insurance Acts Committee is now engaged in preparing a reasoned statement upon the reply given by the Insurance Commissioners on February 19th to the demand for an increased capitation fee. Local Medical and Panel Committees may expect to receive this statement within the next fortnight. As briefly announced in this column last week, a special conference of Local Medical and Panel Committees will be held in the second week of April to consider the position created by the Commissioners' reply. At the last conference in October, 1917, it was proposed that machinery should be set up for the calling of a further conference at short notice, and in this connexion the Insurance Acts Committee will recommend to the next annual conference that the representatives elected to act at any annual conference shall continue to hold office until the commencement of the succeeding annual conference unless any committee should in the interval notify a change. Although this recommendation cannot come into formal operation until the next annual conference in October, the Insurance Acts Committee has decided to act upon it in connexion with the forthcoming special conference in April.

The Emergency Settlement for 1916.

THE Chairman of the National Health Insurance Commission (England) addressed on February 15th a letter to the Insurance Acts Committee stating that, as the result of the calculations just completed, the exact amount of the central medical pool for England and Wales, which was due under the regulations in respect of 1916 and would have been distributed if there had been no emergency settlement, was found to be greater by about 7 per cent. than the amount distributed in accordance with the terms of that settlement. This difference, by the terms arranged, would normally be carried forward for distribution among doctors as part of the 1917 settlement; but, seeing the largeness of the amount, the Commissioners thought it right to bring the matter to the notice of the Insurance Acts Committee, as representing the Conference of Local Medical and Panel Committees, in order to ascertain whether an alternative procedure seemed called for. The Commissioners recall that the object of the emergency settlement was to settle doctors' accounts at a much earlier date than under war conditions was possible within the strict terms of the regulations. They recognize, however, that the decision against reopening the settlement with individual doctors rested on their expectation that the difference between the amounts arrived at by the one process of calculation and the other would be relatively quite small. In view of the substantial difference now disclosed by the final calculations for 1916, they do not consider that they would be justified in insisting upon this condition of the settlement if it should be the general desire among insurance practitioners that the settlement for 1916 should be reopened, so that the sum in question should be distributed among the practitioners who were on the panel for that year, instead of being carried forward to 1917. If such a desire were expressed the Commissioners would approach the Treasury with a view to a corrective settlement for 1916; although some time—possibly three

or four months—would be needed for carrying out the various operations necessitated by that course. If, on the other hand, insurance practitioners generally were content to let the arrangement stand for carrying forward the sum to the 1917 pool, the Commissioners would arrange for immediate payment to all practitioners on the panel for 1917 of the additional 7 per cent. Sir Robert Morant adds that the unexpectedly large difference between the two calculations is due to the operation of war conditions in a manner which could not have been foreseen; and that the Welsh Commissioners concur in his letter.

THE Insurance Acts Committee, on the occasion of the interview with Sir Edwin Cornwall, on February 19th, with regard to the demand for an increased capitation fee, discussed this matter with the Insurance Commissioners. After consideration of the letter, and of the explanations furnished by the Commissioners, the Committee has recommended that the original bargain as regards the emergency settlement should be adhered to. The Committee took into account the fact that hardships might exceptionally arise owing to the carrying forward of the 7 per cent. to the 1917 account; as, for example, in the case of a doctor who was on the panel for 1916, and who, owing to death or disablement, is not on the 1917 panel. If any Panel Committee should desire to make some voluntary arrangement for meeting such cases in which real hardship arises, the Insurance Acts Committee will be glad to help in placing the circumstances before the Insurance Commissioners, who have offered to give what assistance lies within their power. Such assistance must be regarded as voluntary since the obligations of the Commissioners are fulfilled when they carry forward the surplus to the 1917 pool. They will, however, so far as possible, in these exceptional cases furnish information as to the amount which would have been payable had there been no emergency settlement.

THE ORGANIZATION OF THE PROFESSION AND RURAL PANEL PRACTITIONERS.

SIR,—When Dr. Cox addressed the meeting at Preston on November 29th, 1917, I was surprised his speech was not challenged by any rural practitioner who should happen to be present, and I therefore welcomed the forceful letter of Dr. Baigent, of Northallerton, asking Dr. Cox a few pertinent questions, which are of vital importance to those practising in rural areas—questions which I notice have so far remained unanswered.

From sorry personal experience I can vouch for the correctness of the points so well brought out in this letter; all working expenses being vastly increased.

This has caused me within the last few days to send a telegram to the clerk of the Insurance Committee, telling him it is impossible to carry on in one outlying district which I foolishly undertook to oblige his committee. In doing this work, which is of a dwindling nature, I have seriously worn and depreciated two motor cars that it is practically impossible to get repaired. The fact is doctors are leaving the rural areas; the movement has already begun, and will not be easily arrested.

It is largely due to the unequal working of the Insurance Act, and it is therefore up to the Commissioners to at once right this wrong of their creating, before the cry "Back to the land" is applied to the doctor as well as the agricultural labourer.

Another point has not been clearly brought out. Before the working of the Act it was contended that there would be fewer visits in the country than in the town, and on this contention the flat capitation rate was based. No such mistake could have been made by anybody understanding country practice, because it stands to reason a sick man in a town might go to the doctor's surgery, whereas it could hardly be expected of him if the doctor was miles away. This has been proved to be the case, and the old idea proved a fallacy. In a very able and well written pamphlet, "Medical Benefit in Scotland," by W. M. Marshall, Clerk to the Lanark Insurance Committee, this point is well brought out and proved. Under Section 4, "The Country Doctor," he says:

When we contrast the actual services rendered by the country doctor as compared with his urban colleague, we find that in the case of the first it stands at 4.07 (visits and consultations combined) for each person on his list, as compared with 4.37 for each person on the list of the urban doctor.

But the average visits paid infinitely the greater (three consumers) works out at 2.85 for every person on the list of the country doctor, and only 1.71 in the case of the urban doctor.

I write in the hope of stimulating other rural men. Dr. Baigent knows our wants; he has given us a good lead; let us be up and doing, otherwise we shall get no consideration when the increased capitation fee is under discussion. All our panel patients are having higher wages, whilst we have had our working expenses increased far more than they have, and are receiving the same remuneration.

As I write I am informed that the charges for hire of motor cars are to be 1s. a mile travelled, and 4s. an hour for detention. I have many insured persons twelve miles away by road, then a mile or two more to walk. Consider the liabilities and possible expenses attached!

We are not organized on a business footing, and have not recovered from the shock caused by the "rot" of the closing days of 1912. The Divisions should have quarterly meetings at the various centres. An epitome of the points discussed should be sent to all the members in the area, and direct questions put on a form for the individual general practitioner to answer. Each area should appoint a lawyer to be present at all the meetings, and to carry out all the secretarial work, etc. If this were done we isolated individuals would be better able to understand what is expected of us, and should have an organized outlet for our views and grievances.—I am, etc.,

Perth, Feb. 20th.

JOHN L. KINN.

Dr. WILLIAM BAIGENT, in the course of a reply to Dr. Murray's letter printed in the *Supplement* of February 16th, writes:

"What I suggest is that the lot of the country doctor should be considered, and the injustice in his case, when proved, should be remedied before anything is added to the present capitation fee, or the general question of the amount of increase of the capitation grant is decided upon. . . . I think Dr. Murray will agree it is no use moving in this matter after the new capitation fee is arranged. The payment for the work done in the country is not adequate and never has been so under this Act. This is the whole question, and it is useless quibbling whether it is capitation fee, mileage allowance, or drug fund which is at fault. The three combined do not compensate for work done in the country, and often do not pay out-of-pocket expenses; neither does it matter which fund is increased so long as it is adequate and the work made remunerative."

Dr. Baigent wishes to emphasize his point that in no case does he advocate any deduction from anything already granted to the town practitioner. He concludes his letter thus: "If it should unfortunately prove, which I do not for the moment believe, that the rural doctor has not got the full support of the town doctor, it will be the strongest argument in favour of a separate organization for dealing solely with the affairs of the rural practitioner."

Pending publication of the Insurance Commissioners' reply to the demand for an increased capitation fee, and the statement of the Insurance Acts Committee thereon, we do not propose to print further letters on this subject.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty: Temporary Surgeons: J. A. Duffield, to the *Thunderer*; S. Hutchinson, to the *Scimitar*; J. G. Giffith, to the *Lord Nelson*; H. Wilks, to the *Arrogant*; P. A. Cockayne and W. Collins, to Haslar Hospital. To be Temporary Surgeons: W. A. Jolliffe, H. Mullett, A. L. Spencer-Payne.

ROYAL NAVAL VOLUNTEER RESERVE.

Surgeon-Pilot Officer C. C. Elliott to the *Hornet*.

ARMY MEDICAL SERVICE.

Surgeon-Generals ranking as Lieutenant-Generals and Major-Generals.

Notifications appeared in the *Supplement to the London Gazette*, February 27th, carrying out the new arrangement as to the titles of Surgeon-Generals, stated by Mr. Macpherson in his speech on the Army Estimates (see p. 268).

To be temporary Colonels: Temporary Lieut.-Colonels A. S. Woodward, from R.A.M.C., and Sir R. Ross, K.C.B., I.R.S. (Lieut.-Colonel R.A.M.C. 1st Lt., Major ret. I.M.S.).

ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel R. F. Wingate, D.S.O., to be temporary Colonel whilst employed as Assistant Director of Medical Services of a Division.

Temporary Major E. P. Cathcart, M.D., to be temporary Lieut.-Colonel without increased emoluments whilst specially employed.

Major (Temporary Lieut.-Colonel) G. S. Jackson, Northumberland Fusiliers T.F., to be temporary Lieut.-Colonel.

Major (acting Lieut.-Colonel) N. L. Dunkerton relinquishes his acting rank on re-employment.

Major H. A. Fransbury, D.S.O., to be acting Lieut.-Colonel whilst in command of a medical unit.

H. J. Naisson, late temporary Major, is granted the honorary rank of Major.

Major P. R. Thomas, Royal Scots (T.F.), to be temporary Major, July 15th, 1927 (as intimated for notification in the *London Gazette* of August 8th, 1917).

Temporary Captains to be temporary Majors without increased emoluments whilst specially employed: S. W. Williams, I. M. J. O'Farrell.

Lieutenants (temporary Captains) to be Captains: G. A. E. Argyle, S. S. Cross, E. W. Galloway.

Temporary Lieutenants to be temporary Captains: P. Wallace, M. G. Grove (whilst employed at the Lord Derby War Hospital), P. O. Spensley, C. L. Jones-Phillipson, G. A. Mayor, C. Speers, J. S. Bellas, P. A. Adams, P. W. L. Camps, R. L. Rea, W. I. H. Ives, T. H. Campbell, J. W. Carey, J. H. Swan, E. G. Y. Thom, J. G. Elder, A. D. Turnbull, C. W. Windor, G. Heathcote, A. McK. Nixon, G. P. Earle, M. Hooper, W. H. Cam, R. J. A. Davis.

TIX CHANGE.

MEDICAL OFFICER (Lady) attached to a Edinburgh war Hospital is anxious to exchange with fellow officer in Ireland (Dublin or Cork preferred).—Address, No. 800, BRITISH MEDICAL JOURNAL Office, No. 422 Strand, W.C.2.

APPOINTMENTS.

BUNTON, Dr. H. V. M.D., M.R.C.P. Lond., Consulting Anatomist to the Royal Dental Hospital.

KNOX, Dr. N. M.B., C.M., F.R.C.P.S., Medical Referee under the Workmen's Compensation Act, 1906, for the Sherifdom of Lanark, vice Sir David McVail, deceased.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 6s., which sum should be forwarded with the notice not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

MARRIAGE.

BERRY, HELEN.—At St. Mary's, Marylebone, on February 25th, by the Rev. J. W. Roberts, Surgeon J. P. Ferré, R.N., eldest son of Dr. and Mrs. Berry, Kebley, to Missa, elder daughter of Mr. and Mrs. H. E. Horsey, Dorset Square, London.

DEATHS.

SCOTT.—In a nursing home in London on February 19th, after an operation for appendicitis, Kenneth Mackenzie Scott, M.D., F.R.C.S. Edin., M.B. C.S. Eng., of 7, Manchester Square, W., only son of Thomas Graham Scott, of Edinburgh.

STRATON.—On February 22nd, at West Lodge, Wilton, Charles Herbert Stratton, F.R.C.S. Edin., in his 78th year.

DIARY FOR THE WEEK.

ROYAL COLLEGE OF PHYSICIANS OF LONDON, Pall Mall East, S.W.—Tuesday and Thursday, 5 p.m., Goulstonian Lectures by Dr. A. P. Ponson, Diabetes Mellitus and the significance of Acidosis in Disease.

ROYAL SOCIETY OF MEDICINE.—Section of Epidemiology and State Medicine: Friday, 5.30 p.m., Dr. M. Greenwood and Miss Cecily Thompson: An Epidemiological Study of the Food Problem.

DIARY OF THE ASSOCIATION.

Date. Meetings to be Held.

MARCH.

5 Thurs. London: Parliamentary Subcommittee, 4 p.m.
7 Thurs. London: Insurance Acts Executive Subcommittee.

CURRENT NOTES.

Association of Panel Committees.

ON the initiative of the London Panel Committee, an Association of Local Medical and Panel Committees was formed in July last, and a provisional committee was appointed to prepare a scheme and to endeavour to secure the adhesion of all Panel Committees. This proposal was criticized in detail in a document (M. 6) issued by the Insurance Acts Committee to the conference of Local Medical and Panel Committees on October 18th, 1917. As is well known, the conference expressed its renewed confidence in the Insurance Acts Committee of the British Medical Association as the central negotiating body, and deprecated the setting up of new organizations as tending seriously to weaken the forces of the profession. Last month, however, the Association of Panel Committees issued an "explanatory memorandum" on the need for an organization of Panel Committees. In reply, the Insurance Acts Committee has recently issued a circular (M. 22), pointing out that the memorandum is a practical instance of the separatist movement strongly deprecated by the last conference of Local Medical and Panel Committees, and is an attempt to induce committees to break away from the policy freely determined upon in conference. The circular goes on to say that the character, purpose, policy, and actions of the British Medical Association and its Insurance Acts Committee are completely misrepresented in the memorandum. Moreover, the British Medical Association is predominantly representative of insurance practitioners, and all the powers and functions of the new association set out in its memorandum are already exercised by the Insurance Acts Committee. It is suggested that Panel Committees, even if not opposed on general grounds to the formation of new organizations, should scrutinize very closely the financial arrangements proposed for the Association of Panel Committees. Considerations of professional policy, however, give the strongest reason for withholding support from a body solely concerned with sectional interests, since in any fight to maintain the interests of insurance practitioners as such, the whole profession must be united in their support. On such grounds the Insurance Acts Committee invites Panel Committees and insurance practitioners neither to accept the explanatory memorandum as a statement of facts nor to acquiesce in it as a suggestion of policy.

The Scottish Committee on a Ministry of Health.

At a meeting of the Scottish Committee of the British Medical Association, held in Edinburgh on January 26th, detailed consideration was given to the scheme for a Ministry of Health for England and Wales prepared by the Ministry of Health Committee. With regard to central organization, it was resolved that a separate Ministry of Health should be established for Scotland with a Scottish Minister whose sole duty would be to attend to the interests of the health of Scotland. With regard to local administration, it was resolved that the authority to be set up in Scotland should be constituted in a manner analogous to that to be set up under the Education (Scotland) Bill. The Committee attached great importance to the principle that the areas should be such as would require whole-time administrative officers for both clinical and preventive purposes. Subject to the

above modifications and other minor adjustments, the Committee approved the remainder of the scheme, and resolved to submit it as amended to the Council of the Association as the scheme approved for Scotland. It was also decided to submit the views of the Committee to the Secretary of State for Scotland, with a view to the attendance of a deputation thereon.

Association Notices.

CHANGE OF AREA.

Malta Branch.

THE following change has been made in accordance with the Articles and By-laws, and takes effect from the date of publication of this notice:

That the name of the Malta and Mediterranean Branch be altered to "Malta Branch," and that the area of the Branch consist of the Island of Malta and its Dependencies.

INSURANCE.

THE NATIONAL HEALTH INSURANCE ACT, 1918.

THE Insurance Commissioners have issued a memorandum (238, price 2d.) giving a short summary of the main provisions of the National Health Insurance Act, 1918, which will be of special value to approved societies and insurance committees. The Act does not greatly affect panel practitioners, but the following provisions are of direct interest to them:

It is provided that where after inquiry the Commissioners remove a doctor or a chemist from the panel of an area, they may, if they think fit, also remove his name from any other panel list in which it may be included, and may declare that such disqualification shall continue until such time as they otherwise direct.

The Commissioners are also empowered to issue regulations defining the manner and conditions under which medical certificates are to be granted by panel practitioners. This enables the present medical certification scheme to be incorporated in the Medical Benefit Regulations.

The Act also removes the ambiguity as to the maximum amount of administration income available to Panel and Pharmaceutical Committees; it is now made clear that this is a sum divisible between the two committees not exceeding one penny in all in respect of each year.

Provision is also made for the payment out of that income of the travelling expenses, including subsistence, of members in attending meetings of such committees or of any subcommittees thereof.

The Act does not generally come into operation until July 1st, but it is announced that the Commissioners intend as early as possible to publish a revised edition of all the Acts and regulations that will be in force from July 1st. Complete instructions will be issued for the guidance of societies and Insurance Committees in administering the new Act as well as revised model rules to help societies to make amendments in their rules rendered necessary by the new Act.

INQUIRY INTO CENTRAL POOL.

THE following further contributions have been received from Panel Committees towards the cost of the inquiry undertaken by the Insurance Acts Committee into the constitution of the Central Pool:

	£	s.	d.
Wolverhampton Panel Committee	15	15	0
Westmorland Panel Committee	5	0	0
Renfrewshire Panel Committee	1	1	0

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are announced by the Admiralty: Fleet Surgeon S. H. Facey to the *Monarch*; Staff Surgeon R. F. MacMahon to the *St. George*; J. Hadwen, to the *Lancaster*. Surgeon T. J. O'Riordan to R.M. Division, Plymouth. Temporary Surgeons H. E. Thorn to Chatham Hospital; L. B. Hartley to the *Hannibal*; J. E. Purves to the *Gloucester*; C. McDonald to the *Gibraltar*; J. P. Fleming to the *Leviathan*; W. G. Wyllie to Dungavel Auxiliary Hospital; T. C. Blackwell to the *Queen Elizabeth*; K. E. Attenborough to the *Pembroke*, additional, for Chatham Hospital; J. R. Brennan to the *Vivid*, additional for Plymouth Hospital.

ROYAL NAVAL VOLUNTEER RESERVE.

Surgeon Probationers S. G. Harrison to the *Teazer*; H. E. Emmett to the *Sheldrake*; G. R. Woodhead to the *Acorn*; A. Bearlock to the *Archer*; J. Yates to the *Jackal*; A. G. Mathieson to the *Redpole*; A. E. Blackley to the *Lyra*. To be Surgeon Probationers: F. L. Smith, W. G. D. H. Urwick, R. Anderton, F. R. Hall.

ARMY MEDICAL SERVICE.

Major-General T. H. J. C. Goodwin, C.M.G., D.S.O., from Deputy Director-General to be Director-General (temporary), and to be temporary Lieut.-General, vice Lieut.-General Sir Alfred Keogh, G.C.B., M.D., F.R.C.P., ret. pay, March 1st.

Colonel G. B. Stanistreet, O.M.G., from an Assistant Director-General to be Deputy Director-General (temporary), and to be temporary Major-General, March 1st.

Colonel J. R. McMunn, C.M.G., to be Assistant Director-General (temporary), vice Colonel G. B. Stanistreet, March 1st.

Major Sir E. Worthington, C.M.G., M.V.O., R.A.M.C., from a Deputy Assistant Director-General to be an Assistant Director-General, and to be temporary Lieutenant-Colonel, March 1st.

Major P. G. Easton, D.S.O., R.A.M.C., to be a Deputy Assistant Director-General vice Major Sir E. Worthington, C.M.G., March 1st.

Major A. B. Smallman, D.S.O., R.A.M.C., to be a Deputy Assistant Director-General vice Major G. A. D. Harvey, who has vacated March 1st.

Colonel E. G. Browne, C.B., to be temporary Surgeon-General.

Lieut.-Colonel D. D. Shanahan, D.S.O., from R.A.M.C., to be Colonel. The following relinquish the temporary rank of Colonel on reposting: Lieut.-Colonel F. J. Brakeuridge, C.M.G., Brevet Colonel F. Smith, C.B., C.M.G., D.S.O.

Lieut.-Colonel F. S. Penny, C.M.G., to be temporary Colonel whilst employed as Assistant Director of Medical Services of a Division.

ROYAL ARMY MEDICAL CORPS.

To be temporary Lieut.-Colonels: R. L. Joynt, P. C. E. Tribe. Temporary honorary Lieut.-Colonel Sir E. Stewart, K.B.E., relinquishes his commission on ceasing to serve with the British Red Cross Society in France.

Temporary Major J. J. Abraham to be acting Lieut.-Colonel whilst employed as Assistant Director of Medical Services, Head Quarters, Lines of Communications; September 5th, 1917.

Temporary honorary Major R. G. Rows to be temporary honorary Lieut.-Colonel whilst employed at the Moss-Side Military Hospital.

Temporary Captain G. W. Fitz-Henry to be temporary Major (without increased emoluments) whilst specially employed.

Captain V. C. Honeybourne to be temporary Major whilst in command of a field ambulance, December 13th, 1915 (substituted for notification in the *London Gazette* of April 18th, 1916).

Captain A. C. Vidal, D.S.O., to be Major.

S. McC. Boyd to be temporary honorary Captain whilst serving with the British Red Cross Society in France.

A. C. Turner, I. Alluan, D. S. Steele-Perkins, and G. J. Jones, late temporary Captains, are granted the honorary rank of Captain.

Officers relinquish their commissions: Temporary Majors W. C. G. Ashdowne (on ceasing to be employed at the County of Middlesex War Hospital), P. A. Peall. Temporary Captains: W. A. R. Mitchell, P. B. Brown, W. G. Heasman (on account of ill health), A. W. G. Murray, P. B. Harrison, P. W. Brigstocke, C. R. Stewart, R. E. Sedgwick, P. A. Reckless, M. H. Laslett, D. Heron, W. Speedy, F. J. Hunt, H. W. Kaye, P. S. Dixon, F. W. Craig, W. G. Porter, E. G. B. Starkie, R. Younger (and is granted the honorary rank of Captain), G. T. L. Murphy, E. P. Evans, P. McDougall, G. A. Renwick, B. B. Ham (on appointment under the Ministry of National Service), R. H. C. Lyons (and is granted the honorary rank of Captain), G. E. Dodson, J. H. Paterson (on account of ill health), A. B. Moffatt. Temporary Lieutenants: F. E. Larkins, J. H. Nichol, H. Goodman (on account of ill health), R. G. Cunningham, J. D. Gray, J. D. Walker, R. A. Hosegood, A. B. MacCarthy, W. Hibbert, C. B. Simpson, P. W. Ashmore, J. Reid, W. Hartland, T. W. Arnison, J. C. Henderson, M. Crowley, G. Cockroft.

Lieutenants (temporary Captains) to be Captains: J. C. A. Dowse, M. C., C. O. Shackleton, F. P. Freeman.

To be temporary Captains: B. M. Beunett, F. Barues, P. J. O'Reilly, M. C., F. L. Collie, V. E. Sorapure, J. W. Harvey, H. J. Burke, C. Butler.

Temporary Lieutenants A. Dewar, E. A. Bernard, J. N. G. W. McMorris, N. Garrard.

To be temporary Lieutenants: T. M. O'Donnell, H. Topham, W. W. Pearce, G. Marshall, A. B. Rosher, F. O. Stedman, R. H. Paramore, H. S. Liater, G. Stanger, A. N. Fell, E. W. Whiting, J. H. Whiteside, H. L. Taylor, F. Robinson, A. J. Watt, A. Ashkenny, E. Magovouy, A. H. Firth, A. Welby, G. R. Wilson, G. A. Tiechurst, N. Lavers, H. Holt, G. R. Bickersstaff.

The notification in the *London Gazette* of February 11th, 1918, regarding temporary honorary Lieutenant J. F. Harvey is cancelled.

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Captain G. R. Luce to be temporary Major whilst specially employed.

Captain W. J. S. Ingram relinquishes his commission on appointment to the I.M.S.

Lieutenants to be Captains: H. Franklin, D. Clyde, H. D. Gardner, P. B. Hickson, R. T. Lewis, C. V. Brainbridge, J. R. Banks, P. R. Riggall, G. E. L. Simons, G. Day, R. Moser, H. StH. Vertue, M. C., C. J. Penny, R. R. Traill, O. Williams, L. C. Blackmore, R. W. Lush, E. Parker, E. O. Goldsmith, W. Agar, F. N. Sidebotham, J. F. C. Irvine, G. W. Heckels, J. B. E. de Robillard, F. Portas, V. R. Smith, F. C. A. Firth, J. S. White, W. S. Brown, G. M. Kendall, L. Grey, C. Y. Rolerta, T. B. Bailey, D. J. Ratterham, C. W. Armstrong, M. Morrison, R. Newton, T. E. Micklem, L. S. Gathergood, L. Cunningham, R. Woodsale.

The notification in the *London Gazette* of January 31st, 1918, regarding Lieutenant O. C. L. Hughes is cancelled.

To be Lieutenants: H. Roger from Aberdeen University Contingent O.T.C., C. F. Rainer, A. Blackstock, L. C. Goument, W. E. LeG. Clark, A. W. Wells, T. Davies, and J. G. McCaon from University of London Contingent O.T.C., E. B. Ash and W. P. Nelson from Birmingham University Contingent O.T.C., R. H. Chadwick from Leeds University Contingent O.T.C., J. W. C. Fairweather, A. Bullied, G. W. Coombes, D. V. Halstead.

TERRITORIAL FORCE.

ARMY MEDICAL SERVICE.

Major (acting Lieut.-Colonel) H. Richardson to be Assistant Director of Medical Services, and is granted the temporary rank of Colonel whilst so employed, May 2nd, 1917 (substituted for notification which appeared in the *London Gazette* of July 16th, 1917).

ROYAL ARMY MEDICAL CORPS.

Major (acting Lieut.-Colonel) T. A. Barron relinquishes his acting rank on ceasing to command a field ambulance.

To be acting Lieut.-Colonels: Captain J. Miller (whilst commanding a field ambulance); Captain (Brevet Major) R. O. Duo (whilst commanding a casualty clearing station).

Major (acting Lieut.-Colonel) R. W. Brimacombe retains his acting rank whilst commanding a stationary hospital.

Major H. Walker and Captains R. A. Fleming and W. J. S. Bythell are restored to the establishment.

Captain (acting Lieut.-Colonel) A. C. Mallace relinquishes his acting rank on ceasing to command a field ambulance.

Captain R. Sanderson is seconded for duty with a general hospital.

Captain A. Leggat, D.S.O., is seconded whilst holding an appointment as Deputy Assistant Director of Medical Services.

Captain (temporary Major) J. McC. Johnston relinquishes his minor rank on an alteration in posting and is restored to the establishment.

Captain E. B. Argles is restored to the establishment on vacating the appointment of Deputy Assistant Director of Medical Services.

Captain H. A. T. Fairbank, D.S.O., is seconded whilst holding a temporary commission in the R.A.M.C.

Captain P. J. McGinn relinquishes his commission on account of ill health, and is granted the honorary rank of Captain.

Lieutenants to be Captains: W. J. Read, R. O. Knowles.

Private G. T. P. Tatham from O.T.C. to be Lieutenant.

APPOINTMENTS.

CAIRNS, D. L., M.D., Medical Referee under the Workmen's Compensation Act, 1906, for County Court Circuit No. 12, and to be attached more particularly to Huddersfield, Saddleworth, and Holmthurst County Courts, vice P. Macgregor, deceased.

DISTRICT MEDICAL OFFICERS.—R. H. W. Fisher, M.R.C.S., L.R.C.P., Lond., D.P.H., of the Garstang Union, J. Galloway, M.R.D.M.H., of the Gateshead Union, E. G. D. Menzies, M.B., Ch.B., Edin., of the Wearside Union, B. S. Sanders, L.R.C.P. and S. Edin., of the Barnstaple Union.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 6s., which sum should be forwarded with the notice not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

BIRTHS.

MORLEY.—On March 2nd, at 24, Heaton Road, Withington, Manchester, to the wife of John Morley, Ch.M., F.R.C.S., Captain R.A.M.C.(T.), a son.

OWEN.—On the 16th February, 1918, at the Surgery, Abercrombie, Aberdare, Glam., the wife of Ambrose W. Owen, M.D., B.S.Lond., late Captain R.A.M.C.(I.E.F.), of a daughter.

TROTTER.—At 81, Nithsdale Road, Pollokshields, Glasgow, on 3rd inst., Dr. Margaret J. Trotter (née Brown), wife of Dr. G. Clark Trotter, Paisley, a daughter.

DIARY FOR THE WEEK.

MONDAY.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W.—8.30 p.m., Mr. H. Graeme Anderson: Aviation and Medicine and the Selection of Candidates for the Air Service.

FRIDAY.

CURRENT NOTES.

The Demand for an Increased Capitation Fee.

IN the reply given by the Insurance Commissioners on February 19th to the demand for an increased capitation fee for insurance practitioners, Sir Edwin Cornwall stated that that part of the case for increased remuneration which was based on the increased cost of living "must be examined not as specially affecting insurance administration, but as relating to similar applications from other sections of the community, and therefore to be decided in accordance with the general policy of the Government in dealing with applications of the kind." Upon this point the Insurance Acts Committee recently approached the Chancellor of the Exchequer, requesting an authoritative explanation of the Government's policy, for the information of the forthcoming special conference of Local Medical and Panel Committees on April 11th. Mr. Bonar Law consented to receive a deputation at the Treasury on Friday, March 15th, to discuss this matter.

A Ministry of Health.

ON March 13th, in the House of Commons, Mr. Bonar Law stated that although he could not then make any statement as to the intention of the Government to proceed with a bill this session for the establishment of a Ministry of Health, it was hoped that agreement would be arrived at as to the setting up of such a Ministry. On the same day Dr. Addison, Minister of Reconstruction, received members of the Ministry of Health Committee of the British Medical Association, and discussed with them the proposals contained in a draft bill of which he is in charge.

Travelling Expenses of Members of Panel Committees.

UNDER the provisions of Section 41 (2) of the National Health Insurance Act, 1918, it is now possible for payment to be made, out of the statutory levy, of the travelling expenses (including subsistence) of members of Panel Committees attending meetings of such committees or any subcommittees thereof.

INSURANCE.

NATIONAL INSURANCE, 1914-17.

ENGLAND.

(Concluded from page 21.)

THE extra work imposed on Insurance Committees in dealing with enlistments and discharges from the forces and the entry into insurance of new workers, mainly women, is described, and it appears that, owing to the extent to which the number of enlistments has exceeded the number of new entrants, the committees have suffered a considerable loss of income at a time when salaries of staffs have had to be raised while payments were being made to members of the staffs absent on military service, and a special Treasury grant of £25,000 has been made to meet these losses. Notwithstanding numerous additions,

the strength of the panels has declined owing to resignations and deaths due to the war. On January 1st, 1915, the strength of the panels was 15,955, which was reduced on January 1st, 1917, to 15,293, these figures including the doctors on more than one panel, but excluding duplicates within each area. In the same period there has also been a reduction in the number of chemists' shops from 10,304 to 9,983. A statement is given showing the distribution of the General Medical Benefit Fund among the various Insurance Committees, and the totals for England are as follows:

Final settlement for period ending Jan., 1914 ...	£4,481,312
Emergency " " " " Dec., 1914 ...	4,247,229
" " " " Dec., 1915 ...	4,042,168
" " " " Dec., 1916 ...	3,844,936

THE total thus distributed during the four years amounts to £16,615,646. It is observed that the emergency settlement with doctors for 1915 was £10,562 in excess of the proper amount for a final settlement. This was taken into account in the following year, but the proper amount for a final settlement for 1916 has not yet been ascertained. It appears that up to the end of 1916 there had been twenty-two inquiries about doctors, resulting in the removal of fifteen doctors from the panel and fines in two other cases, and seven inquiries about chemists, resulting in the removal of four from the panel, with a fine in one other case. In addition, there had been forty cases of appeal by doctors against surcharges for excessive prescribing, and eight appeals against decisions of Insurance Committees under Art. 45 (16) of the regulations of 1913. Up to the end of 1916 the Commission has withheld grants in thirty cases to doctors and chemists for various breaches of their agreements, the sums withheld varying from £5 to upwards of £400.

IN regard to sanatorium benefit, in August, 1917, the number of approved tuberculosis dispensaries was 370, and the beds in approved residential institutions 11,700. At the end of September, 1917, comprehensive agreements between Insurance Committees and local authorities for residential and dispensary treatment of tuberculosis had been made in thirty-two of the forty-nine counties (excluding London) and in fifty-five of the seventy-eight county boroughs. In the remaining areas there were only temporary arrangements for beds in any approved institution, but in eight areas there were no provisions for dispensary treatment. The special arrangements for London are dealt with fully.

THERE are a number of appendices, to some of which references have been made already, but one dealing with the cost of drugs and appliances for the insured deserves further notice. It appears that, taking England as a whole, there has been a gradual reduction in both the average cost of prescriptions and the average cost per insured person. Figures are given for each area, but, taking the total averages, in 1914 the cost per prescription was 8.2d., in 1916 it had fallen to 6.1d., and the average cost per insured person had fallen from 2s. 2d. to 1s. 10d. In 1916 in twenty-eight of the total 126 areas the cost per insured person was still over 2s., the highest being 2s. 10d. On the other hand, in eighteen areas the cost per insured person was below 1s. 6d.; some areas have made as little as 1s. 1d. to 1s. 2d. suffice.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty: Temporary Surgeons: A. G. Williams and A. R. Doyle to Haslar Hospital; E. J. Tongue to the *Edmont*; R. G. Tottenham to the *Wildfire* for Sheerness Barracks and Yard, vice Ross; J. C. Sinclair to the *Hannibal*.

ROYAL NAVAL VOLUNTEER RESERVE.

To be Surgeon Probationers: H. Reid, W. E. H. Banks, P. L. Richardson, E. E. D. Gray, I. G. Williams, W. H. Summerskill, L. R. A. Wells.

ARMY MEDICAL SERVICE.

To be temporary Colonels: Temporary honorary Colonel J. F. O'Carroll, Lieut.-Colonel W. E. Hume, R.A.M.C.(T.F.), Captain J. A. Nixon, R.A.M.C.(T.F.).

ROYAL ARMY MEDICAL CORPS.

To be temporary Lieut.-Colonels: Captain E. F. Buzzard, R.A.M.C.(T.F.), whilst serving at the Tooting Military Hospital; Major C. H. Fagge (Brevet Lieut.-Colonel, R.A.M.C.(T.F.)), whilst serving with the Hampshire Military Hospital; C. G. Douglas, M.C.

Majors F. E. Rowan-Robinson, G. A. Kempthorne, D.S.O., and R. G. Merdith relinquish the acting rank of Lieut.-Colonel on reposting.

Major G. W. G. Hughes, D.S.O., retains the acting rank of Lieut.-Colonel whilst in command of a casualty clearing station.

Captains to be acting Lieut.-Colonels whilst in command of field ambulances, August 15th, 1915: G. H. Stevenson, P. S. Tomlinson, B. Johnson (substituted for notification in the *London Gazette* of October 13th, 1916).

To be acting Lieut.-Colonels whilst in command of a medical unit: Major W. C. Croly, Captain L. F. K. Wav.

Temporary Major C. J. Caddick and temporary Captains P. H. Gillies and J. J. Dunne relinquish their commissions on taking up duty under the Ministry of National Service.

Captain W. Robertson, R.A.M.C.(T.F.), to be temporary Major whilst in charge of Robroydon Hospital, Glasgow.

Captain F. A. Hepworth, R.A.M.C.(T.F.), to be temporary Major whilst serving with the County of Middlesex War Hospital.

Temporary Captain F. F. Muecke to be temporary Major (without increased emoluments).

Temporary Captain W. F. G. Scott to take rank and precedence as temporary Captain in the Corps and in the army as if his appointment to that rank bore date April 27th, 1917.

Granted honorary rank of Captain: A. A. Hindson and M. McNiff, late temporary Captains.

Temporary Lieutenants relinquish their commissions on appointment under the Ministry of Pensions: H. E. Davison, C. R. A. Thacker, H. A. Whitcombe.

Officers relinquish their commissions: Temporary Major G. H. Clark, temporary honorary Major H. Fritchard (on ceasing to be employed with No. 1 British Red Cross Hospital), Captains O. K. Hartridge and H. P. Cuthbert (and are granted the honorary rank of Captain), temporary Captains G. W. Armstrong and R. V. Steele (on account of ill health contracted on active service), A. D. Morris, P. G. M. Simpson, J. S. Taylor, J. E. Manlove, S. Jackson, G. E. Dodson, T. J. Taunton, L. A. Drake, E. A. Pearson, J. McMurran (on account of ill health contracted on active service and is granted the honorary rank of Captain), temporary Lieutenants A. Kirkhope, A. R. H. Harrison, P. M. Tolmie, C. L. Meyers, P. Quinn, E. E. Owens, E. C. Burnett, J. Blakeley, G. Gordon, F. E. Mathews, T. Archdeacon, H. B. Watson, M. C. Irwin, J. C. Pearce, C. J. G. Bonrhill.

Temporary Lieutenants to be temporary Captains: M. C. Gardner, S. J. McC. Bradshaw, W. E. Barrett, A. K. S. Wyborn, J. M. N. S. Bickerton, J. L. H. Paterson, D. Mitchell, J. Cameron, M. J. Ryan, P. O. W. Browne, G. P. Jones, H. W. Catto, J. Freeman, G. H. Joseph, J. E. Ratcliffe, D. C. Ogilvie, W. F. Box, N. S. Sherrard, H. Archer, J. R. Dick, H. E. Batten, J. L. D. Lewis, M. Liddell, R. McCaffrey, C. G. Lees, J. J. Reidy, H. B. Emerson, R. M. Liddell, R. McCaffrey, J. C. Jones, C. J. Marshall, R. S. Drew, D. F. Brown, H. N. Wright, J. F. Allen, V. J. Bonavia, E. M. Brown, H. H. Bywater, F. Humphreys, A. H. H. Barclay, P. W. L. Andrew, J. P. Grainger, L. C. Rorke, J. Holland, C. H. Bannerman, N. B. Stewart, J. T. Titterton, P. L. Hope, A. R. H. Geyer, W. L. Nicholson, R. C. Hutchinson, E. G. Bark, C. H. Medlock, A. E. A. Carver, R. Montgomery, J. C. Mead.

Second Lieutenant F. J. Power, from Unattached List T.F. to be temporary Lieutenant (substituted for the notification in the *London Gazette* of December 7th, 1917).

C. H. G. Gostwyck, late temporary Lieutenant, is granted the honorary rank of Lieutenant.

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Brevet Major J. N. McLaughlin relinquishes his commission on account of ill health contracted on active service, and is granted the honorary rank of Major.

Captains J. H. Ward and W. McK. H. McCullagh, D.S.O., M.C., to be acting Lieut.-Colonels whilst in command of a medical unit.

To be Lieutenants: J. R. Cox and M. W. Giffen, from University of London Contingent, O.T.C.; A. E. M. Fuoss.

OVERSEAS CONTINGENTS.

CANADIAN ARMY MEDICAL SERVICE.

Medical Commissioner: Surgeon-General G. C. Jones, C.M.G., C.A.M.C. relinquishes his appointment.

Assistant Directors of Medical Services: Temporary Colonels H. A. Chisholm, D.S.O., and E. C. Hart, C.M.G.

Temporary Captain W. J. MacKenzie, C.A.M.C., relinquishes his appointment as Deputy Assistant Director of Medical Services.

CANADIAN ARMY MEDICAL CORPS.

Temporary Major (acting Lieut.-Colonel) A. Croll relinquishes the acting rank of Lieut.-Colonel on ceasing to be specially employed.

Temporary Lieutenants to be temporary Captains: E. M. Blair, E. Craig, A. W. Brodie, H. P. Swancesky, T. E. Pevez, A. S. Lamb, L. M. Matthews, C. H. P. G. Benning, F. N. K. Falls, B. Cabanna, H. L. Warshawsky, A. P. Murtagh, W. F. McIsaac, J. D. Moore.

SOUTH AFRICAN MEDICAL CORPS.

Temporary Major (acting Lieut.-Colonel) R. N. Pringle, D.S.O., relinquishes the acting rank of Lieut.-Colonel on ceasing to command a unit.

Temporary Major C. M. Murray to be acting Lieut.-Colonel whilst commanding a unit.

P. A. Smuts to be temporary Lieutenant.

TERRITORIAL FORCE.

ARMY MEDICAL SERVICE.

Lieut.-Colonel (temporary Colonel) W. M. Roccoft, C.M.G., relinquishes his commission on account of ill health, and is granted the honorary rank of Colonel.

ROYAL ARMY MEDICAL CORPS.

Major A. B. S. Stewart to be Lieut.-Colonel.

To be acting Lieut.-Colonels whilst commanding a field ambulance: Major G. W. Miller, D.S.O., Captain V. F. Munro, M.C.

Captain H. Pinto-Leite is restored to the establishment on vacating appointment as Deputy Assistant Director of Medical Services.

Captain G. A. Auden is seconded whilst holding an appointment as Deputy Assistant Director of Medical Services.

Captain W. Robertson is seconded whilst holding a temporary commission in the R.A.M.C.

CURRENT NOTES.

Conference of Local Medical and Panel Committees.

A SPECIAL conference of representatives of Local Medical and Panel Committees will be held under the auspices of the British Medical Association at the Connaught Rooms, Great Queen Street, London, on Thursday, April 11th, at 10 a.m. The main purpose of the conference is to consider the position with regard to the demand for an increased capitation fee and the unfavourable reply of the Chairman of the National Health Insurance Joint Committee thereto. At the request of the Insurance Acts Committee the Commissioners are issuing to every insurance practitioner a document containing the correspondence on this subject, together with Sir Edwin Cornwall's reply on the whole matter. The Insurance Acts Committee has issued to every insurance practitioner a copy of the statement which the Committee has prepared in reply. In this way the whole of the case is now in the hands not only of Local Medical and Panel Committees but of their constituents throughout the country. The conference will also consider the action taken by the Insurance Acts Committee since October last in respect of the demand for an increased mileage allowance, and of the organization of the profession with a view to collective bargaining, and it is expected that a report will be received from the president of the Institute of Actuaries on his investigation into the constitution of the central pool.

Inquiries, Discreet and Indiscreet.

The Standing Ethical Subcommittee of the Association on March 12th considered paragraph 4 of a circular issued by the Local Government Board on February 22nd, which directs attention to the importance of Wassermann tests for patients who have had miscarriages, and of examinations of material from cases of stillbirth. The circular goes on to say:

It is also desirable that when these cases are notified the Medical Officer of Health should make discreet inquiries into the circumstances, in consultation with the District Medical Officer of Health if the notification is received by him. The inquiries should be made through the medical practitioner if one was in attendance at the time of birth.

The Subcommittee was of opinion that medical practitioners in attendance on such cases are debarred by considerations of professional secrecy from disclosing to the Medical Officer of Health or any other person information which they have acquired in the course of their professional attendance, and that it would be wrong, both legally and ethically, to furnish the information which the Local Government Board has suggested Medical Officers of Health should endeavour to obtain.

Travelling Expenses of Members of Panel Committees.

In the SUPPLEMENT of March 9th it was noted that provision is made in the National Health Insurance Act, 1918, for the payment out of the statutory levy of the travelling expenses (including subsistence) of members of Panel Committees attending meetings of such committees, or any subcommittees thereof. In repeating this information in a current note in last week's SUPPLEMENT, it should have been stated again that the Act does not come into general operation until July 1st, 1918, at the earliest.

Central Surgeries.

The Central Medical War Committee, on March 20th, considered a report on the results of an inquiry into existing central surgery systems in various parts of the country. It was found that central surgeries had been set up as an emergency measure in six localities. The Local Medical War Committee in each case was asked to reply to a set of questions designed to furnish a common basis for comparing the essential points in each scheme in respect of (1) origin and scope, (2) organization, (3) financial arrangements, and (4) results of experience. Most of the schemes deal with panel patients only, but in two areas private patients are included. A central consulting room, with the necessary accommodation and clerical staff, is the normal arrangement. Attendance at the surgery is by rota, and varies according to the number of doctors doing the work and the amount of work required. Dispensing and midwifery are not normally undertaken. Free choice of doctor exists so far as is practicable, but continuity of treatment presents difficulties. The financial arrangements vary much, but generally speaking, after deductions for absentees and for working expenses, the receipts are divided among the attending doctors in proportion to the work done. The verdict of experience as to economy of time is favourable. Where private patients as well as panel patients are dealt with a far higher proportion of the latter make use of the central rooms, and it appears that as an expedient for keeping private practices intact the scheme fails, but, on the whole, satisfaction seems to have been general so far as panel practice is concerned. Generally speaking, the measure of success is the measure of co-operation between patients, local authorities, and doctors. This is easier to obtain in panel than in private practice, although questions of class distinction do not seem to have been raised in any of the six areas. The report was mainly discussed from the point of view of economy in medical man power. It was agreed that pre-existing local harmony was essential for the success of any such scheme.

War Emergency Fund of the Royal Medical Benevolent Fund.

The following further subscriptions have been received from Divisions of the Association, and have been passed on to the Treasurer of the War Emergency Fund. The names of individual subscribers are published monthly in the advertisement pages of the JOURNAL.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty:—
Temporary Surgeons: J. M. Harrison to the *Hindustan*; S. C. Shaw to the *Amethyst*.

ARMY MEDICAL SERVICE.

Surgeon-General R. Porter, C.B., is placed on retired pay (substituted for notification in the *London Gazette* of February 1st, 1918).

Colonel E. G. Browne, C.B., C.M.G., to be temporary Major-General (substituted for notification in the *London Gazette* of February 28th, 1918).

Lieut.-Colonels from R.A.M.C. to be Colonels: T. H. M. Clarke, C.M.G., D.S.O., (temporary Colonel) S. L. Cummins, C.M.G., (temporary Colonel) J. Poe, D.S.O.

ROYAL ARMY MEDICAL CORPS.

Majors to be Lieut.-Colonels: J. T. Johnson, D.S.O., (temporary Lieut.-Colonel) W. R. P. Goodwin, D.S.O., (acting Lieut.-Colonel) W. L. Steele, (acting Lieut.-Colonel) W. Riech, C.M.G.

Major E. T. Potts, D.S.O., to be temporary Lieut.-Colonel whilst employed as Assistant Director of Medical Services of an Army, November 4th, 1917 (substituted for notification in the *London Gazette* of December 14th, 1917).

Major H. H. J. Fawcett, D.S.O., retains the acting rank of Lieut.-Colonel whilst in command of a casualty clearing station.

To be acting Lieut.-Colonels whilst in command of medical units: Majors C. Bramhall, J. M. M. Crawford, and Captain R. M. Davies.

Officers relinquish their commissions:—Temporary Captains: R. M. Fraser, W. G. Jones, A. H. Parkinson, H. W. Wilson, J. G. Leslie, E. Rommel, C. G. Todd (on account of ill health contracted on active service), W. J. Hogg (on taking up duty under Ministry of National Service); temporary Lieutenant F. R. Smyth.

Late temporary Captains granted the honorary rank of Captain: W. G. Porter, E. C. E. Van-Eyck.

W. F. Thompson to be temporary Captain whilst employed at County of Middlesex War Hospital, December 1st, 1917 (substituted for notification in the *London Gazette* of February 12th, 1918).

INDIAN MEDICAL SERVICE.

Majors to be Lieut.-Colonels, July 27th, 1917: T. H. Delany, J. W. F. Rait, E. J. O'Meara, G. Tate, R. F. Baird, A. T. Gage, G. McPherson, S. Hunt, A. G. Sargent, de V. Condon, H. A. J. Gidney, W. Lethbridge.

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

To be Lieutenants: G. E. MacAlevey, I. H. Zortman, C. S. Parker, and H. E. Rhodes, from University of London Contingent, O.T.C.; R. B. Britton, from Bristol University Contingent, O.T.C.

OVERSEAS CONTINGENTS.

CANADIAN ARMY MEDICAL SERVICE.

Assistant Director of Medical Services: Temporary Colonel R. M. Simpson, C.A.M.C., vice temporary Colonel H. M. Jacques, D.S.O., C.A.M.C.

CANADIAN ARMY MEDICAL CORPS.

Temporary Majors to be temporary Lieut.-Colonels: (Acting Lieut.-Colonel) A. S. I. Donaldson; P. G. Brown.

Temporary Major C. F. L. Hazzard, from Canadian Light Horse, to be temporary Major (substituted for *London Gazette* notification of 1 December 14th, 1917, incorrectly describing name as C. F. C. Hazzard).

Temporary Captain (acting Major) T. H. Bell, M.C., to be temporary Major.

Temporary Major A. Sterling, from New Brunswick Regiment, to be temporary Captain, January 21st, 1918 (substituted for notification in the *London Gazette* of February 7th, incorrectly describing name as A. Stirling).

Temporary Captain W. Mason is dismissed the service by sentence of a general court-martial, January 24th, 1918.

Temporary Captain A. B. Chapman, M.C., to be temporary Major, December 6th, 1917 (substituted for notification in the *London Gazette* of February 12th, 1917, incorrectly describing promotion as acting Major and specifying date as December 22nd, 1917).

Temporary Captain B. E. Kelly to be temporary Major, December 6th, 1917 (substituted for *London Gazette* notification of January 28th, 1918, incorrectly describing promotion as acting Major, and specifying date as December 26th, 1917).

Temporary Captain W. T. Ewing to be acting Major.

To be temporary Majors: Temporary Captains R. J. Gardner, W. H. Scott, M.C., G. W. Hall, H. W. McGill, and (acting Major) R. St. J. MacDonald.

Temporary Captain W. B. MacDermott ceases to be seconded.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonels (temporary Colonels) A. R. Tweedie and D. Smart relinquish their temporary rank on vacating appointment as Assistant Directors of Medical Services, and are restored to the establishment.

Lieut.-Colonel (temporary Colonel) H. G. Falkner relinquishes his temporary rank on vacating appointment as Assistant Director of Medical Services.

Major (temporary Lieut.-Colonel) E. C. Montgomery-Smith, D.S.O., is seconded whilst holding an appointment as Assistant Director of Medical Services, and to be temporary Colonel whilst so employed.

Majors (acting Lieut.-Colonels) R. Stirling and H. E. Corbin relinquish their acting rank on ceasing to command a casualty clearing station and a field ambulance respectively.

Major R. T. Hughes and Captain H. F. Wilkin to be acting Lieut.-Colonels whilst commanding a casualty clearing station and a field ambulance respectively.

Major J. A. Masters is retired under the provisions of para. 116 T.F. Regulations, and is granted permission to retain his rank and to wear the prescribed uniform.

Captain (acting Lieut.-Colonel) O. L. Appl too reverts to the acting rank of Major with pay and allowances of a Captain, June 6th, 1917 (substituted for notification in the *London Gazette* of August 3rd, 1917).

Captain (temporary Major) A. Mowat relinquishes his temporary rank on an alteration in posting.

Captain P. G. Phillips relinquishes his commission on account of ill health, and is granted the honorary rank of Captain, December 7th, 1917 (substituted for notification which appeared in the *London Gazette* of December 6th, 1917).

Captain J. A. Nixon to remain seconded whilst holding a temporary commission in the A.M.S.

Captain G. B. Robinson to be Major.

Captains S. F. St. J. Steadman and J. M. McQueen are seconded. The announcement regarding Captain J. M. McQueen which appeared in the *London Gazette* of February 8th, 1918, is cancelled.

TERRITORIAL FORCE RESERVE.

To be Captain: Captain J. Aitken, from R.A.M.C.

VOLUNTEER FORCE.

County of London Volunteer Regiment, 15th Battalion.—J. Norton to be Medical Officer and temporary Lieutenant.

Rutland Volunteer Regiment, 1st Battalion.—J. S. P. Dickey to be Medical Officer and temporary Lieutenant.

East Yorkshire Medical Volunteer Corps.—J. Whiteside to be temporary Lieutenant.

East Yorkshire Regiment, 1st Battalion.—H. Wales to be Medical Officer and temporary Lieutenant.

Surrey Medical Volunteer Corps.—Medical Officer and temporary Captain W. Gripper, from 9th Battalion Surrey Volunteer Regiment, to be temporary Captain.

Northumberland Volunteer Regiment, 4th Battalion.—J. G. Miller (late Captain R.A.M.C., T.F.) to be Medical Officer and temporary Captain.

EXCHANGE.

M.O. to battalion in France wishes exchange with M.O. or Officer in hospital in Lincoln or Lincolnshire, or S. Yorks.—Address No. 1100, BRITISH MEDICAL JOURNAL Office, 429, Strand, W.C.2

APPOINTMENTS.

Meetings of Branches and Divisions.

GLASGOW AND WEST OF SCOTLAND BRANCH: GLASGOW
EASTERN DIVISION.

At the annual meeting on February 22nd the following office-bearers were appointed:

Chairman: Dr. Syson. *Vice-Chairman:* Dr. J. M. Glaister.
Interim Honorary Secretary and Treasurer and Representative to Representative Meetings: Dr. J. Wishart Kerr. *Deputy Representative:* Dr. Syson. *Representatives on Branch Council:* The Chairman, Representative and Secretary.

It was resolved to ask Sir Auckland Geddes for information as to appointments on the National Service Boards in the city, and to suggest that the older members of the profession should have preference.

General satisfaction was expressed at the action of the Association which had resulted in raising the standard of professional charges. The Secretary was instructed to reissue the cards with regard to giving early notice of professional visits, accompanied by a circular letter asking members of the profession to adhere to the time laid down.

A meeting of the Division was held on March 12th, when Dr. J. S. Syson presided. The SECRETARY read a letter from Dr. Norman Walker, Commissioner of the Medical Service for Scotland, in reply to a communication authorized by the Division, on the subject of the National Service Boards. Dr. Walker's letter was not considered a sufficient answer, and Dr. THOMAS RUSSELL moved that the Division Secretary be instructed to write again, pointing out that men of military age are employed on the National Service Boards, that their places should be taken by men of non-military age, and further, if more men are required to man the Boards, a further appeal should be made generally to the profession. Dr. GLAISTER seconded and the motion was unanimously carried. The subject of fees for notifications of infectious diseases was again brought up. After discussion, it was agreed that the matter should be brought up at the next Branch Council meeting by the representatives of the Division.

At an ordinary meeting of the South-Eastern of Ireland Branch at Kilkenny, on March 6th, when Dr. James occupied the chair, a resolution was unanimously adopted, on the motion of Dr. Grace, seconded by Dr. Stephenson, conveying to the relatives of the late Dr. Laffan, Cashel, deep sympathy in the great loss they had sustained.

Association Notices.

ANNUAL REPRESENTATIVE MEETING, 1918.

The Annual Representative Meeting of the Association, 1918, will be held in London on Thursday, July 25th, 1918, and following day(s) as may be required.

Notices of Motion.

Notices of Motion from Divisions and Branches for the consideration of the Annual Representative Meeting, proposing to make any addition to or any amendment, alteration, or repeal of any Regulation or By-law, or to make any new Regulation or By-law, or proposing material alteration of the policy of the Association in matters relating to the honour and interests of the medical profession or of the Association (Article 30,

By-law 40), must be published in the **BRITISH MEDICAL JOURNAL** not later than the issue of May 25th, and for this purpose should be received by me not later than May 16th, 1918.

By order,

ALFRED COX,

Medical Secretary.

January 28th, 1918.

INSURANCE.

NATIONAL INSURANCE, 1914-17. SCOTLAND.

THE section of the Report on the Administration of National Health Insurance, 1914-1917, which deals with Scotland, states that at the commencement of the war the number of insured persons in Scotland was 1,542,284, of whom 1,520,000 were members of approved societies. The Commissioners express the opinion that the panel practice in Scotland had as early as July, 1914, "reached a fairly high standard as compared with the best traditions of private practice." The difficulty in the larger towns in maintaining a satisfactory medical service owing to the number of doctors called to the forces had been met in some cases by the provision of medical bureaux or consulting rooms where the panel doctors attended on a rota; this is said to effect a great saving of their time and energy. The system was started in Dundee, and at a later date Aberdeen and Edinburgh followed suit, but less success has attended the system in Glasgow. The total number of panel doctors at the beginning of the war was 1,754; it had shrunk to 1,229 in 1917, and this, it is stated, left only just about sufficient to meet average requirements with only a very narrow margin for emergencies. To provide medical benefit for a large munition works in the south of Scotland, special arrangements were made in conjunction with the Minister of Munitions on a more comprehensive scale than the National Insurance alone provides, and assistance was also given by the Board of Trade in providing medical attendance for lumbermen.

As in the case of England the expenditure of approved societies for sickness and maternity benefits has progressively decreased since 1914, while disablement benefit has increased over five-fold. The value of the maternity hospitals in Scotland has been recognized by approved societies; all these hospitals have agreed to charge not more than 10s. for intern and 7s. 6d. for extern cases. Without affecting a woman's right to free choice of doctor or midwife, societies representing over 400,000 members have decided to enter into agreements with some maternity hospital.

The total receipts of the Insurance Fund for Scotland for 1916 were £5,604,534, including a balance from 1915 of £3,130,649, Exchequer grants £441,302, and sale of insurance stamps £1,820,958. The payments include £991,977 to societies for benefits and administration, and £636,078 to Insurance Committees for medical and sanatorium benefits and administration; the sum of £3,892,292 was handed over to the National Debt Commissioners for temporary investment. The payments made out of the mileage grant in 1916 amounted to £17,312 for the Lowlands, mileage for the Highlands being now dealt with by the Highlands and Islands Medical Service Board from a grant of £10,000.

The inflation of the index registers was a source of great difficulty, and as it became clear that societies and

Insurance Committees were unable to deal properly with the matter, the Commission undertook the task, but is finding that even with the assistance of a clearing house system the effects of war conditions make proper revision of the registers extremely difficult. It appears from a table showing the number of surgery attendances and visits per 100 insured persons in every area that, taking the country as a whole, surgery attendances averaged 186 and visits 119 per 100 insured persons in 1915, both being lower than in 1914. In the burghs the surgery attendances averaged 210 and visits 86, while in the counties the surgery attendances averaged 153 and visits 166. Thus the county practitioners not only gave a greater total number of consultations but the visits, which take up much more time, exceeded the surgery attendances. The total cost of drugs and appliances decreased from £102,516 in 1914 to £80,451 in 1916. This decrease, in spite of the rise in prices, is attributed to the reports of the checking bureaux calling attention to irregularities and excessive prescribing. The average cost per prescription in 1916 was 9.95d. as compared with 9.74d. in 1915.

As regards sanatorium benefit, the total number of beds available for tuberculosis in approved institutions was 2,507 in 1917, which is equivalent to one bed for 1,800 of population; there are 23 tuberculosis dispensaries. The number of insured persons and dependants that received treatment in 1916 was 3,193. The total income of the Insurance Committees for medical and sanatorium benefits and administration for 1915 was £682,521, as compared with £789,276 in 1914.

LOCAL MEDICAL AND PANEL COMMITTEES.

Bedfordshire.—At a meeting on January 29th it was agreed that panel doctors in the area are entitled to the special mileage grant for the following reasons: (1) the scattered population of the area and inaccessibility of many outlying and isolated cottages, and (2) the large number of patients living over three miles from the doctor's residence. It was considered that the simplest and fairest form of remuneration would be an addition to the capitation fee for all patients living over three miles from a doctor's house.

Derbyshire.—At a meeting on February 21st it was agreed that the extra mileage grant should be distributed by way of an increase proportionate to the amount of the ordinary grant, and that mileage for discharged sailors and soldiers should be included. It was resolved that the pamphlet from the London Panel Committee on the Association of Panel Committees should "lie on the table."

West Riding of Yorkshire.—At a meeting on February 1st the opinion was expressed that the mileage grant should be extended to cover the whole of the West Riding in all cases in which a patient lived more than three miles from the nearest panel doctor. It was decided to sign form M.19 issued by the British Medical Association, agreeing to abide by the Insurance Acts Committee in the scheme for collective bargaining.

Renfrewshire.—At a meeting of the Panel Committee on February 20th the sum of £1 ls. was subscribed towards the cost of the actuarial inquiry into the composition of the Central Medical Benefit Pool as an expression of confidence in the British Medical Association and appreciation of the labours of that body on behalf of panel practitioners. A letter from the London Panel Committee in favour of setting up a new medical council, to be consulted in connexion with service under the Insurance Acts or any other form of national medical service, was allowed to lie on the table.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are announced by the Admiralty:—Temporary Surgeons: R. W. Brand to the *Crescent*, additional; H. C. Mano to Malta Hospital; J. Matheson to Portland Hospital.

ROYAL NAVAL VOLUNTEER RESERVE.

Surgeon Probationers: B. M. Tankin to the *Hydra*; F. J. M. Larkine to the *Renard*. To be Surgeon Probationers: G. E. W. Felce, B. T. Richarda, E. Savage, J. P. T. Milla, L. M. Jennings, F. R. Oliver, G. S. Need, H. Holtby, E. S. Etheridge, B. M. G. Thomas, P. Conacand, F. C. Cazens.

ARMY MEDICAL SERVICE.

Major F. D. Boyd, C.M.G., R.A.M.C. (T.F.), to be temporary Colonel.

ROYAL ARMY MEDICAL CORPS.

To be acting Lieut.-Colonels whilst in command of a medical unit: Major J. A. Turnbull, D.S.O., Captains A. N. R. McNeill, W. H. S. Burney.

Captain J. B. A. Wignmore, M.B., relinquishes the acting rank of Lieut.-Colonel and reverts to the acting rank of Major with pay and allowances of his substantive rank.

Captain W. B. Puxton, D.S.O., M.C., retains the acting rank of Lieut.-Colonel whilst in command of a convalescent dépôt.

The undermentioned having ceased to be employed with No. 83 (Dublin) General Hospital relinquish their temporary commissions: Lieut.-Colonel H. O. Drury; Major J. Lumsden; Captains J. W. Killen, C. M. Benson, S. H. Law.

Temporary Captains J. C. Pouoden and M. Bridgman to be temporary Majors (without increased emoluments) whilst specially employed.

Captain A. W. Byrne is placed on retired pay on account of ill health.

W. C. G. Ashdown to be temporary honorary Major.

H. W. Kaye, late temporary Captain, is granted the honorary rank of Captain.

Temporary Lieutenants to be temporary Captains: G. A. Wron, H. G. G. Jeffreys, E. H. K. Altonunao.

Officers relinquish their commissions: Temporary Major H. C. Barclay (and is granted the honorary rank of Major). Temporary Captains: O. E. Boyce, E. J. M. Watson, A. C. Tait, G. Mnir, H. T. Douglas, A. Pimm, H. McMillan, Donaldson (on account of ill health contracted on active service, and is granted the honorary rank of Captain). Temporary Lieutenants: W. B. M. Martin, K. O. Edwards.

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

A. G. W. Compton, M.C., late Captain, is granted the honorary rank of Captain.

To be Lieutenants: W. L. Dandridge and A. S. Westmorland, from University of London Contingent O.T.O.

OVERSEAS CONTINGENTS.

CANADIAN ARMY MEDICAL CORPS.

Temporary Major G. Royce to be temporary Lieut.-Colonel.

Temporary Captain J. A. MacMillan to be temporary Major.

Temporary Major J. G. Hunt ceases to be seconded for duty with the Anglo-Russian Red Cross Hospital, Petrograd, Russia, without pay and allowances.

Temporary Major V. E. Henderson, from Central Ontario Regiment, to be temporary Captain.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel J. F. Dobson, from permanent personnel, to be Lieut.-Colonel, whose services will be available on mobilization.

Major (temporary Lieut.-Colonel) E. C. Montgomery-Smith, D.S.O., to be Lieut.-Colonel, November 1st, 1917.

To be acting Lieut.-Colonels whilst commanding a field ambulance: Captains (temporary Majors) H. S. Beadles and J. R. Pooler, Captain W. Brown.

Captain (acting Lieut.-Colonel) L. West relinquishes his acting rank on ceasing to command a field ambulance.

Captain F. A. Hepworth remains seconded whilst holding a temporary commission in the R.A.M.C.

Captain C. Rogers, M.C., relinquishes his commission on account of ill health and is granted the honorary rank of Captain.

Captain B. Stracey relinquishes his commission on account of ill health and is granted the honorary rank of Captain.

Lieutenant H. L. Farmer to be Captain.

TERRITORIAL FORCE RESERVE.

Major J. R. Benson from a field ambulance to be Major.

VOLUNTEER FORCE.

County of London Volunteer Regiment, 21st Battalion.—J. L. I. Moore to be Medical Officer and temporary Lieutenant.

Northern Counties Highland Volunteer Regiment, 11st Battalion.—Medical Officer and temporary Captain D. Manfadyen resigns his commission.

APPOINTMENTS.

DORSON, W. T., M.R.C.S., L.R.C.P., District Medical Officer of the Uxbridge Union.

PATERSON, C. E., M.D. Edin., Certifying Factory Surgeon for the Farnborough No. 1 District, co. Hants.

WEBB, R. E. S., M.R.C.S., L.R.C.P., First Assistant Medical Officer, Portsmouth Parish Infirmary, etc.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 6s., which sum should be forwarded with the notice not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

BIRTH.

STUART.—On March 23rd, at Leamore, Walsall, to Violet (Mollie), the wife of A. Murray Stuart, F.R.C.S. Edin.—a son.

MARRIAGES.

PEREZ-GRIFFIN.—On March 13th, at Walton-on-Thames, by the Rev. W. K. Buschell, Victor Perez, M.B., B.S. Lond., to Lilian Griffin, late Q.A.I.M.N.S.R.

TANNER-HUMPHRIES.—On March 14th, at St. Margaret's, Plumstead, by the Rev. A. Thomson, W. E. Tanner, M.S., F.R.C.S., temporary Captain R.A.M.C., to Marie Louise, daughter of Mr. and Mrs. Edwin Humphries, Plumstead Common.

INSURANCE.

NATIONAL INSURANCE, 1914-17.

WALES.

A GREAT part of the report of the English Commission applies also to Wales, but there are certain distinctive features which deserve notice.

The provision of immediate treatment for tuberculous sailors and soldiers on their discharge from the forces is in some respects simplified in Wales by the agreements that have been entered into between the Insurance Committees and the Welsh National Memorial Association, which has arranged for interim treatment pending more permanent treatment under schemes of Insurance Committees.

The membership of approved societies at the beginning of the war was 712,458. The total income of the Welsh Insurance Fund for 1916 was £1,243,079 which included £843,291 from sale of stamps and £280,559 Exchequer grants, while the payments include £537,192 to societies for benefits and administration, £300,102 to Insurance Committees for medical and sanatorium benefits and administration and £210,000 handed over to the National Debt Commission for temporary investment. The amount distributed from the General Medical Benefit Fund for 1916 was £243,757 as compared with £288,068 in 1913, the amount having decreased every year. The panel doctors on January 1st, 1917, numbered 1,099 against 1,222 on January 1st, 1915; about 164 panel doctors were serving with the forces. In the same period the number of chemists supplying drugs fell from 691 to 652. There were 15 approved systems or institutions providing medical attendance to the insured with a total membership of 28,310, the two largest being the Ebbw Vale Workmen's Medical Society with 9,611 members, and the Tredegar Medical Aid Society, with 5,997 members. A special table is given showing the increase in deaths from tuberculosis in Wales and Monmouthshire. In 1913 there were 2,402 deaths from pulmonary tubercle and 788 from other forms of tuberculosis, while in 1916 the figures were 2,812 and 803 respectively; it is suggested that the increase is due partly to the stress and strain of war conditions and partly to the greater prevalence of influenza, pneumonia, and bronchitis in the later years.

INVESTIGATION OF EXCESSIVE PRESCRIBING.

THE English Insurance Commissioners have issued a Memorandum I.C./237 on the procedure of Panel Committees in connexion with the investigation of cases of excessive prescribing. It reminds Panel Committees that a mere examination of the statistics provided by the Pricing Bureaux does not discharge the duty of the committees, and that a surcharge based on figures alone cannot be justified. The function of the statistics is to enable committees to select cases which appear specially to require investigation; in such cases they must only be regarded as furnishing *prima facie* evidence of extravagance. Panel Committees should not confine their attention to cases which from the statistics appear to require investigation, but should make what are termed "dipping" examinations as a check upon the scripts of doctors whose average cost is not exceptionally high. Committees are also reminded that they are required to investigate "from time to time," and that they should not wait until statistics for the whole year are available.

STATISTICS OF MEDICAL BENEFIT.

SIR,—Now that we have completed five years under the National Health Insurance Act, it may be of interest to some of your readers if I send you some statistics of the working of the Act in my practice comprising over 1,000 insured members in a town district.

	1913.	1914.	1915.	1916.	1917.	Average 6 Years.
Number of index cards ...	1029	1167	1080	1110	1120	1101
Number who received attention	625	701	656	657	595	627
Total number of attendances and visits	5189	5550	4674	4675	4532	4940
Ratio of visits to attendances	$\frac{1}{10}$	$\frac{1}{10.5}$	$\frac{1}{9.75}$	$\frac{1}{9.64}$	$\frac{1}{11.6}$	$\frac{1}{10.29}$
Average number of attendances per patient	8.6	8.34	7.12	7.11	7.6	7.75
Average number of attendances per day		16	16.76	13.5	12.5	14.69
Remuneration per year ...	£386	£341	£364	£354	£352	£359
Remuneration per attendance	s. d. 1 5 $\frac{1}{2}$	s. d. 1 2 $\frac{1}{2}$	s. d. 1 6 $\frac{1}{2}$	s. d. 1 6	s. d. 1 6 $\frac{1}{2}$	s. d. 1 5

The number of certificates given was over 2,000 each year. If one-tenth of the attendances is put down as visits at 2s. 6d. each, the remainder works out at 1s. 4d. per attendance at the surgery.

I keep the index register as accurate as possible, but the payment is, on the average, £26 a year less than 7s. a head, which means, I suppose, that my list is "inflated" to the extent of seventy-five persons every year.

The attendances at the surgery have been decidedly less since the introduction of the pharmacopoeia for Kent, the use of which undoubtedly saves the time and worry of both doctor and chemist, and incidentally the drug bill.—I am, etc.,

CHARLES FIRTH, M.D.Lond., F.R.C.S.Eng.

Gravesend, March 29th.

A contribution of £10 10s. has been received by the Insurance Acts Committee from the Devonshire Panel Committee towards the costs of the Central Pool Inquiry.

LOCAL MEDICAL AND PANEL COMMITTEES.

Birmingham.—At a meeting of the Panel Committee on March 6th the memorandum issued by the Association of Panel Committees was considered. It was decided that no advantage would be gained by joining such an association. It was decided to appeal to all practitioners on the Birmingham Panel to support the War Emergency Fund of the Royal Medical Benevolent Fund.

East Sussex.—At a meeting on February 12th it was decided to advise practitioners in East Sussex, in view of the extra cost of living and working expenses, to make a general increase of 25 per cent. in their charges. In regard to the extra mileage grant, it was decided that the basis of payment ought to be for each patient two miles or more from the doctor's residence an extra annual payment of 3s. per head on a capitation basis, and a proportionate increase where payment is made on an attendance basis. A communication on the aims of the Association of Panel Committees was directed to lie on the table.

Staffordshire.—At a meeting on January 29th it was resolved to make a contribution of 50 guineas towards the expenses of the Central Pool Inquiry as a mark of appreciation of the work of the Insurance Acts Committee. It was resolved to ask the Commissioners for extra mileage for all practitioners who have insured persons residing more than three miles from the nearest doctor, at the rate of 1s. per annum per mile or part thereof over three miles.

CURRENT NOTES.

Promotion and Pay of Territorial and Special Reserve Medical Officers.

The Naval and Military Committee of the British Medical Association at its last meeting considered the second report of the Departmental Committee on Promotion of Officers in the Special Reserve, New Armies, and Territorial Forces, which dealt with the promotion and pay of officers of the R.A.M.C. Special Reserve and Territorial Forces. The recommendations of the Departmental Committee were printed in the JOURNAL of February 2nd, p. 164. The recommendation not accepted by the Government was that "officers of the R.A.M.C. Territorial Force and Special Reserve who joined before the war should be put on a level with temporarily commissioned contract officers as regards pay, allowances, and gratuities where they would gain thereby." The Naval and Military Committee resolved to recommend to the Council of the Association that, in view of the Government having negatived the first recommendation of the Departmental Committee, steps be taken to urge the Government to equalize the present discrepancy between the remuneration of the junior officers of the R.A.M.C. (T.F.) and that of temporary commissioned officers by increasing the gratuity to which junior officers of the R.A.M.C. (T.F.) are entitled upon demobilization by such amount as may be necessary to make the total remuneration received by such officers for the period of their mobilized service equal to the total remuneration received by a temporary officer of the R.A.M.C. for a similar period of service. The Naval and Military Committee has also prepared a memorandum examining in detail the second report of the Departmental Committee. It is noted that this report, though bearing the date September 1st, 1917, was not published until January 30th, 1918.

The Labour Party and a State Medical Service.

Representatives of the Association met the Executive Committee of the Labour Party on April 19th and discussed the question of a state medical service. It was ascertained that the Labour Party was not pledged to any definite scheme, but was anxious to discover the best means for securing that the highest medical skill should be available to the poorest members of the community under any development of the medical services of the country brought about under a Ministry of Health. The members of the Executive Committee expressed themselves as anxious to secure a strong medical advisory committee, which they believed would be of the greatest assistance in ascertaining the best system for securing the object they had in view. They had not yet set up such a committee, but they proposed to do so, and would welcome representatives nominated by the British Medical Association so long as such representatives were at least not out of sympathy with the views of the Labour Party.

Soldiers on Furlough Suffering from Venereal Disease.

A private medical practitioner who attended for venereal disease a soldier on furlough (not within reach of a military hospital) on submitting his account therefor on Army Form O. 1667 to the local military medical authority was

informed that, in view of the nature of the disease, the patient himself should be held responsible for payment. As the result of representations by the British Medical Association the War Office, after thanking the Association for bringing the case to its notice, intimated that the refusal to pay the account in question was due to error, and that instructions had been given for its settlement.

War Emergency Fund of the Royal Medical Benevolent Fund.

The following further subscriptions have been received from Divisions of the British Medical Association in response to the recent appeal, and have been passed on to the Treasurer of the War Emergency Fund. The names of individual subscribers are published monthly in the advertisement pages of the JOURNAL.

South Essex Division, per Dr. J. F. Walker, Hon. Sec. 2 s 4	
(Three instalments)	152 17 0
Nottingham Division and Medical-Chirurgical Society jointly, per Drs. A. Polson and H. E. Tawes, Hon. Secs.	250 0 0
Dudley Division, per Dr. L. A. Taylor, Hon. Sec.	4 4 0

Cost of Central Pool Inquiry.

The following amounts have been received towards the cost of the inquiry into the Central Pool undertaken by the Insurance Acts Committee:

Oxford Local Medical and Panel Committee	2 s 4
Stoke of Peterborough Local Medical and Panel Committee	3 3 0
Warwickshire Local Medical and Panel Committee	1 1 0
	5 8 0

Association Notices.

MEETING OF COUNCIL.

The next Meeting of Council will be held on Wednesday, April 24th, in the Council Room, 422, Strand, London, W.C.2.—By order,

GUY ELLISTON,

April 11th, 1912. Financial Secretary and Business Manager.

INSURANCE.

INSURANCE COMMITTEES.

County of London.—At the meeting of the London Insurance Committee on April 4th it was stated that on April 1st the number of soldiers receiving sanatorium benefit in the Committee's institutions was 190, and the number on the waiting list 199, not including advanced cases. The number of male civilians in institutions was 206, and on the waiting list 157, and the number of women in institutions was 65, and on the waiting list 74. The chairman of the Sanatorium Benefit Subcommittee expressed himself as not very hopeful of any immediate result of the negotiations which are proceeding with the London County Council with regard to the framing of a comprehensive scheme for the prevention and treatment of tuberculosis.

The Insurance Commissioners having expressed the opinion that for the quarter ending June 30th the Committee would be well advised not to pay for the present the rate of advance which obtained during the year 1917—namely, £50 per 1,000 of the count of the index register—the Committee agreed that the advance should be made in two instalments, the first to be calculated at the rate of 2d. per insured person included in the practitioners' lists, and the amount of the second instalment to be left open.

LOCAL MEDICAL AND PANEL COMMITTEES.

Glasgow Burgh.—At a meeting on March 4th it was resolved to make strong representations that a general practitioner who is deemed qualified to administer salvarsan ought to be remunerated for such administration. It was decided to press for an earlier settlement of practitioners' accounts, or alternatively

for a larger payment on account each quarter or in the course of a year. No action was taken with regard to a circular from the Association of Panel Committees.

Renfrew County.—The Panel Committee has been informed that the Commissioners, while allowing the inclusion of a clause in the local agreement for the current year imposing a compulsory levy to meet the administrative expenses of the Panel and Local Medical Committees, decline to sanction such clause for the future. The Committee has approved the 1917 emergency drug list for the year 1918, and has decided to continue the present arrangements for dispensing drugs in rural areas.

Shropshire.—The following resolution has been passed:

That, whilst welcoming the concession that the new mileage grant for war conditions should apply to all practitioners practising in a rural area, the Shropshire Panel Committee being of opinion that, as the said grant was purely for the purpose of meeting increased cost in travelling owing to war conditions, consider that it should apply to distances beyond three miles, and that in respect of each person on a doctor's list a capitation fee of 1s. per mile be paid for every complete mile beyond three miles.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty: Fleet Surgeon S. Conner to the *Gibraltar*. Staff Surgeon H. C. Devas to the *Argonaut*, additional. Temporary Surgeons W. L. Glegg to the *Pindar*; L. Mandel to the *Europa*; H. B. Bullen to the *Active*.

ROYAL NAVAL VOLUNTEER RESERVE.

Surgeon C. S. McK. Murison to Keyham College.

ARMY MEDICAL SERVICE.

Major-Generals placed on retired pay: F. J. Jencken, C.B., H. G. Hathaway, C.B.

Lieut.-Colonel A. J. MacDougall to be temporary Colonel whilst employed as Assistant Director of Medical Services of a Division.

Temporary Lieut.-Colonel A. G. Phear to be temporary Colonel.

Surgeon-Lieut.-Colonel Sir Peter J. Freyer, K.C.B., I.M.S.(ret.), to be temporary honorary Colonel.

ROYAL ARMY MEDICAL CORPS.

Temporary Lieut.-Colonel (Major and Brevet Lieut.-Colonel, R.A.M.C.T.F.) C. H. Fagge relinquishes his temporary commission on reposting.

Temporary Major (Captain, R.A.M.C.T.F.) A. W. Falconer, D.S.O., to be temporary Lieut.-Colonel.

To be acting Lieut.-Colonels whilst in command of a medical unit: Majors G. W. Heron, D.S.O. (June 11th, 1917), G. A. K. H. Reed (from November 13th to December 16th, 1917), C. W. O'Brien (January 8th, 1918), A. L. Ostray (January 10th, 1918); Captains C. McQueen, M.C. (from 1 December 7th to 17th and from December 24th to 26th, 1917), A. Irvine-Fortescue (February 28th, 1918); temporary Captains R. C. Phelps (December 14th, 1917), K. W. MacKenzie, M.C. (February 21st, 1918).

S. R. Scott to be temporary Major.

Temporary Captain G. H. Ward-Humphreys to be temporary Major whilst specially employed.

Temporary Captain J. B. Howell to be temporary Major (without increased emoluments) whilst specially employed.

R. V. Steele and F. W. Martin, late temporary Captains, are granted the honorary rank of Captain.

Captain A. L. Urquhart to be acting Major whilst in command of a medical unit.

Temporary Captain Francis M. Byrne is dismissed the service by sentence of a general court-martial, March 16th.

Temporary Lieutenants to be temporary Captains: D. N. Anton, P. McL. Shiels, R. D. Passey, A. F. Campbell, H. Cardin, F. D. Crew, E. W. Goble, R. G. Hill, L. R. G. de Glanville, K. G. Colquhoun, J. S. Byrne, A. W. C. Bennett, O. H. Bulloch.

Officers relinquish their commissions: Temporary Captains R. J. P. McCulloch, A. B. Simpson, A. McL. Picher (granted the honorary rank of Captain), W. C. W. Glenn, J. R. MacCulloch (on account of ill health and is granted the honorary rank of Captain), C. A. R. Nitch, T. J. Burton, H. J. Cooper, C. F. Dillon-Kelly, L. C. Dillon-Kelly, G. D. Compston, C. H. MacLean (on account of ill health contracted on active service and is granted the honorary rank of Captain), E. H. Wood, H. Wachter.

Temporary Lieutenants: M. Munro, T. M. T. Dishington, A. C. S. Waters, A. J. Macleod, A. W. Hare, H. W. James (on account of ill health and is granted the honorary rank of Lieutenant), W. A. Clement, J. M. Dickson, G. T. Watson, E. Whalley, R. J. Lytle, W. Venis, J. Good, A. G. Harvey, J. P. Ryan, R. M. Danks, J. N. Beadles, G. Nelson (on account of ill health contracted on active service and is granted the honorary rank of Lieutenant). Temporary honorary Lieutenants J. D. Milne, A. O. Raymond, B. Farrior.

Lieutenants (temporary Captains) to be Captains: G. D. Harding, A. M. McCutcheon, J. A. Andrews, M.C., R. C. Robertson, M.C., H. H. McHolland, A. C. Jebb, J. A. W. Edden, E. B. Marsh, A. L. Aymer, J. H. Pendered, M.C., A. N. Minns, D.S.O., M.C., W. W. McNaught, J. P. Litt, H. A. Harbison, M.C., W. G. Shakespear.

Temporary Lieutenant I. L. MacInnes to take rank and precedence in the corps and in the army as if his appointment to that rank bore date January 10th, 1918.

A. W. Hall, late temporary Lieutenant, is granted the honorary rank of Lieutenant.

RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Major J. Clarke relinquishes the acting rank of Lieut.-Colonel on reposting.

Captain W. C. Borrie and Lieutenant H. L. Mooney relinquish their commissions on account of ill health.

The notification in the *London Gazette* of March 12th, 1918, regarding Lieutenant G. V. Davies is cancelled.

To be Lieutenants: T. L. Crawhall, from Durham University Contingent O.T.C.; O. D. Pullan, from Leeds University Contingent O.T.C.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Major (Brevet Lieut.-Colonel) C. H. Fagge is restored to the establishment.

Major (temporary Lieut.-Colonel) A. C. Goodwin relinquishes his temporary rank on ceasing to command a field ambulance.

Major D. Todd to be acting Lieut.-Colonel whilst commanding a general hospital.

Major G. Hall, C.M.G., to be acting Lieut.-Colonel whilst in command of a general hospital, and is seconded whilst so employed.

Major F. D. Boyd, C.M.G., is seconded.

Major A. H. Hogarth, from T.F.R., to be Major with precedence as from July 30th, 1916.

Captain (Brevet Major) C. N. Draycott and Captains C. S. Brown and J. D. L. Currie relinquish their commissions on account of ill health and are granted the honorary rank of Captain.

Captain H. G. L. Haynes to be acting Lieut.-Colonel whilst commanding a field ambulance.

Captains to be acting Majors whilst commanding sections of field ambulances: W. Bowater, D.S.O., K. A. P. R. Murray, A. E. P. McConnell, M.C., C. E. K. Herewith, H. J. D. Smythe.

Captain (temporary Major) P. Howie relinquishes his temporary rank on an alteration in posting.

Captain J. M. Whyte is seconded for duty with a general hospital.

Captain J. R. Mitchell relinquishes his commission on account of ill health and is granted the honorary rank of Captain.

TERRITORIAL FORCE RESERVE.

Major (temporary Lieut.-Colonel) J. Nightingale from R.A.M.C. to be Major.

To be Captains: Captains P. W. Young from a general hospital, J. A. Watt from a field ambulance, T. J. Mackie from R.A.M.C.

VOLUNTEER FORCE.

Essex Volunteer Regiment, 1st Battalion.—Medical Officer and temporary Lieutenant W. Benton resigns his commission.

Lincolnshire Medical Volunteer Corps.—R. A. Glegg (late Lieutenant, Lincolnshire Regiment), to be temporary Lieutenant.

Lancashire Motor Volunteer Corps.—W. J. R. Dunn to be Medical Officer and temporary Captain.

Lancashire Volunteer Regiment, 6th Battalion.—J. R. H. Duboué to be Medical Officer and temporary Lieutenant.

West Riding Motor Volunteer Corps.—P. Rattray, H. W. Whiteley, and C. L. Pattison (late Lieutenant R.A.M.C.) to be Medical Officers and temporary Captains to Nos. 1, 2, and 5 groups respectively; E. A. White to be Medical Officer and temporary Lieutenant to No. 3 group.

EXCHANGE.

M.O. attached to a hospital in London area wishes to exchange with M.O. in Edinburgh neighbourhood.—Address, No. 1350, *British Medical Journal* Office, No. 429, Strand, W.C.2.

APPOINTMENTS.

DISTRICT MEDICAL OFFICERS.—G. Forden, M.R.C.S., L.S.A., of the Bridgewater Union. T. W. Powell, M.R.C.S., L.R.C.P.Lond., D.P.H., of the Newcastle-in-Emlyn Union.

CERTIFYING FACTORY SURGEONS.—A. L. Grant, M.B., Ch.B. Edin., for the Burghhead District, co. Elgin. J. O. Jones, L.R.C.P. and S. Edin., L.R.F.P.S. Glasg., for the Holywell District, co. Flint.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 6s., which sum should be forwarded with the notice not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

DEATHS.

CROMBIE.—On March 30th, James Crombie, M.B., B.Sc., J.P., of Highden, Sidcup, Kent, aged 61.

JAMES.—On the 6th inst. at 71, S. Mark's Road, North Kensington, suddenly, Moses Prosser James, M.D., late Lecturer on Materia Medica of the London Hospital and Physician to the Throat Hospital, Golden Square, W., aged 82 years. R.I.P.

MOYNHAN.—On April 8th, at Carr Manor, Meanwood, Leeds, Eva Ellen Moynihan, daughter of the late Captain Moynihan, V.C., 8th (King's) Regiment.

PHILP.—Killed in action on March 26th, Captain O. H. G. Philp, M.B. Cantab., R.A.M.C., attached Manchester Regiment (late of Cantuque House, Hereford), most dearly loved husband of Margaret Philp, aged 32.

DIARY FOR THE WEEK.

WEDNESDAY.

HUNTERIAN SOCIETY. 1, Wimpole Street, W.—5.15 p.m., Discussion on Nervous Breakdown, to be opened by Dr. Edwin Ash.

ROYAL SOCIETY OF MEDICINE.—Monday, 5 p.m., Discussion on the Future of the Medical Profession under a Ministry of National Health, to be opened by Dr. J. F. Gordon Dill. Section of Therapeutics and Pharmacology: Tuesday, 4.30 p.m., Dr. A. J. Whiting: Comparative Value of Digitalis Group of Remedies in Whiting: Fibrillation. Section of Pathology: 8.30 p.m., Dr. E. H. Kettle: Tumours arising from Endothelium. Dr. J. Murray: Autogenous Grafting. Section of Dermatology: Thursday, 4.30 p.m., Cases. Section of Otolaryngology: Friday, 4 p.m., Cases and Specimens. 5 p.m., Mr. Richard Lake: Aural Bacteriæmia.

SPECIAL CONFERENCE OF REPRESENTATIVES OF LOCAL MEDICAL AND PANEL COMMITTEES.

London, Thursday, April 11th, 1918.

A SPECIAL CONFERENCE of representatives of Local Medical and Panel Committees, called by the British Medical Association to consider principally the action to be taken with regard to the demand for an increased capitation fee, was held on April 11th, at the Connaught Rooms, London. Dr. J. A. MACDONALD, LL.D., Chairman of Council, presided, and 168 insurance areas of Great Britain were represented.

The CHAIRMAN, in opening the proceedings, said that the matters for consideration, so far as concerned the immediate policy to be adopted with regard to increased remuneration, might be presented in the form of three questions: (1) Whether they should agree to continue the treatment of insured persons without an increase of capitation fee; (2) whether, having agreed to the first, they should press the Government for an allowance towards the increased cost of carrying on insurance practice, especially as regards travelling, as suggested by Sir Edwin Cornwall; and (3) whether they should press also for some increase in the grant to those members of the profession whose professional income was below £500 a year.

Action Taken by Insurance Acts Committee.

The action taken by the Insurance Acts Committee in respect to the demand for an increased capitation fee was first reported, and after some debate the report was approved. Dr. H. B. BRACKENBURY, Chairman of the Committee, said that the members of the deputation who had waited on Mr. Bonar Law had been greatly impressed by his reception of them. The Chancellor had spoken with frankness and sincerity, and not as the head of a department who desired to say smooth things in order to rid himself of a departmental difficulty; that being the case they were much moved by his appeal to them. The Committee had met the previous night and considered the agenda and all the information as to the feeling in the country, and although putting down no resolution for submission to the Conference, had framed certain suggestions as a general idea of the policy which, in its opinion, should be pursued. These were:

1. That it would be quite impossible to carry out successfully a refusal to renew contracts for 1919.
2. That it would be right to take the line that, while maintaining the equity of their claims, in view of the national circumstances, and the Government's appeal, they should not press the general claim at the moment.
3. That nevertheless an endeavour should be made to obtain an extra allowance owing to the increased cost of travelling, over and above the present mileage grant, and to arrive at an equitable formula for the distribution of such extra allowance.
4. That arrangements should be entered into which would allow individual practitioners whose net professional income was not more than £500 a year to apply for a percentage increase of their remuneration for insurance work.

5. That it was desirable at once to reconsider the methods of distribution of available funds as between area and area and between practitioner and practitioner, and thereafter to reconsider also the general financial arrangements and terms of service with a view to their settlement on an improved basis at the earliest convenient time.

These were not recommendations to the Conference, but the Committee considered, in the light of the information available, that these general lines were the most politic to adopt under the present circumstances. Whether or not it was desirable in the abstract to refuse to renew contracts for 1919, it would be impossible to carry through such a thing successfully; at the same time, while waiving the general claim, they could consistently press for the concessions indicated, which everybody admitted to be legitimate.

Four or five representatives criticized the action of the Committee, chiefly for what they described as the month's delay before the demand of the last Conference was presented. Dr. Brackenbury pointed out that the Conference was held on October 18th; time had to be allowed to summon the Committee, whose members were widely scattered over the kingdom, but the letter was sent to the Insurance Commissioners by November 5th, and after a proper consideration of its case, which was necessary if it was to be presented effectively, the Committee met the Commissioners on November 15th. He did not think this could be described as dilatory.

The Demand for an Increased Capitation Fee.

A large number of motions were on the agenda paper, several of them in a similar sense, regarding the policy to be pursued in connexion with the demand for an increased capitation fee. It was agreed to take first the motion which presented the clearest issue. This was by Salford in the following terms:

That panel practitioners be urged not to renew without modification their present contracts from January, 1919, and that all possible steps be taken immediately to make such action unanimous.

Dr. C. R. O. GARRARD, in moving the above, said that the last Conference unanimously resolved to ask for an increased capitation fee of 10s., yet no representative at that time could have been so sanguine as to imagine that the terms would be granted without a struggle. His committee thought that the demand ought to be persisted in, and that in view of the depleted ranks of the profession in civil practice at the present time they had a great tactical advantage, which would disappear when practitioners returned in large numbers from the army. It was not merely that the payment was inadequate, but that the agreement itself was inequitable, and bound one side only. A resolution of this kind would not embarrass the Government more now than it would have done last October;

indeed, he contended that it need not embarrass the Government at any time, because the Government had taken power under the Act to suspend medical benefit. If the Conference yielded on this point, it would mean an accession of power to the Panel Medico-Political Union, which would probably then become strong enough to take action on its own account. Most likely in the result they would be beaten, and in that case the shackles would be riveted on the profession for a generation; but if, on the other hand, the Union was sufficiently supported to gain its point, the British Medical Association as a factor in medical politics would disappear.

A motion by the London Committee was taken as an amendment to this, and read:

That while still maintaining the justice of the demand for an increased capitation fee, and protesting against the tenor of Sir Edwin Cornwall's reply on February 19th, the Conference, in view of the difficult position of national affairs, and having no desire to embarrass the Government at the present time, considers that it is its patriotic duty not to press the general claim at the moment.

Dr. H. J. CARDALE said that the London Committee did not for one moment think that the justice of the demand had been diminished, and it wished to protest in the strongest way against the reply given by Sir Edwin Cornwall to the deputation; the reply was unworthy of a Minister of the Crown. Yet he would ask the Conference to proceed no further with any definite action, owing to the grave cloud which overshadowed the nation. The Representative of Salford appeared not to appreciate the alteration in this respect which had taken place since last October. Apart from their evident duty as a profession, what would be the effect upon the public of calling a "strike"—for that was the name which would be given to it—next January, whereby an enormous dislocation would be caused in the medical treatment of fourteen millions of people?

Some discussion followed, in the course of which Dr. Cardale's appeal was seconded by Major J. ORTON (Coventry and Warwickshire), who urged that to defer action *sine die* was the only course to adopt, although they in no way went back on the justice of their claim. Among those who spoke against the amendment were one or two Lancashire representatives, who said that Lancashire was unanimous, or practically so, in adhering to the demand. Dr. E. H. M. STANCOMB (Southampton) also opposed the amendment, saying that he and those who thought with him did not call for a strike or a withdrawal of service, but only asked practitioners to contemplate the non-renewal of their service unless some modification was forthcoming. Nobody was satisfied with the present agreement, and on this matter public opinion, even as represented by Insurance Committees and friendly societies, would be on the side of the doctors. Dr. BRACKENBURY, in supporting the amendment, said that Lancashire might or might not be unanimous; he doubted its complete unanimity; but the largest Panel Committee in the country was unanimous on the other side, and so were several other of the larger committees, including Middlesex and Essex. It was idle to declare that the suspension of medical benefit would not embarrass the Government. It would be necessary to call together every Insurance Committee and to arrange with every friendly society how it should carry on, and it would thrust an immense amount of work on Government departments. Dr. J. BENNETT (Warrington) said that Lancashire was not unanimous, and he had been sent to oppose the tenor of the Salford motion, though it was recognized by his committee that they must not damp down their activities.

The London amendment was then put to the meeting and carried by a very large majority, and was subsequently adopted as the substantive resolution, with seven dissentients.

Additional Travelling Allowance.

The Conference then turned to the question of an additional travelling allowance, and the CHAIRMAN, to facilitate discussion and crystallize several motions of similar effect, moved:

That the Insurance Acts Committee be instructed to press for an additional grant to meet increased practice expenses, especially travelling expenses, as described in paragraph 18 of Sir Edwin Cornwall's letter of February 19th, 1918.

Dr. BRACKENBURY said that if the Conference requested the Insurance Acts Committee to try and get, over and

above the original and the extra mileage grant, a further amount set apart to be distributed to the profession, then the Committee would endeavour to arrive at a formula which would result in as equitable a distribution as possible. He doubted whether a large conference could discuss the particular method or formula to be adopted. Clearly, if this line were to be pursued, it must benefit the rural more than the urban practitioner. In reply to questions, he said he could not hold out much hope of the Government considering anything but travelling expenses.

Several rural representatives spoke on the motion, pointing out the heavy additional burden of expense to the practitioner in country districts. Dr. J. P. WILLIAMS-FREEMAN (Hampshire) said that practitioners should be prepared to furnish the actual number of miles they travelled in a year and the actual number of visits they paid, and the first figure divided by the second would give the average distance travelled per visit, and this would form a basis of allocation. Dr. E. LEWYS-LLOYD (Merionethshire) maintained that the kind of roads travelled on ought to be taken into consideration as well as the distance. Dr. J. BENNETT (Warrington) said that his was a semi-rural and a semi-industrial practice, and he found that he could visit three patients in the industrial district for one patient in the rural district. Other speakers thought that no mileage allowance would meet all cases, and that the only proper basis was an increase of the capitation fee. Ultimately, however, the motion was adopted *nemine contradicente*, together with an addendum proposed by Dr. STANCOMB: "And that practitioners concerned should be urged forthwith to furnish details upon which an equitable formula shall be based."

Grants in the Case of Professional Incomes below £500 a Year.

On this further question the CHAIRMAN again submitted a simple resolution, which covered a number of motions on the agenda:

That the Insurance Acts Committee be instructed to press for a grant, in respect of the increased cost of living due to the war, for insurance practitioners whose net professional income from all sources is within the limits observed by the Government in dealing with civil servants, as described in Paragraph 20 of Sir Edwin Cornwall's letter.

In reply to questions, he said that the limit below which it was proposed that the grants should be available was £500 a year. The procedure would not entail any public declaration from the practitioner as to his income. It would only be necessary for him to obtain a certificate from his surveyor of taxes to the effect that his taxable professional income was below the limit stated, and forward it to the Commissioners. He would then receive, if the concession were obtained, a certain percentage increase on his capitation grant; in some cases the increase of civil servants' incomes had been 10 per cent. The basis they were advised to put forward was the net professional income from all sources, and expressly excluded non-professional income.

The two lady representatives at the Conference, Dr. JESSIE THOM (Dundee) and Dr. MABEL RAMSAY (Plymouth) associated themselves against the proposal, the former expressing the view that an *ad misericordiam* appeal would weaken the position of practitioners when it came later on to making an application for a general increase in the capitation grant. Other representatives thought that it should only be carried out if an appreciable number of practitioners desired it; that if only a small proportion applied for the extra grant this would be used against the profession generally when they came to demand an all-round increase; that payment should be made from the Commissioners direct, and not through the Insurance Committees, otherwise the privacy of the arrangement could not be maintained; and, as to the general principle, that all extra payments should be made on the merits of the case, and not as a dole to the poorer members of the profession. The proposal was supported on behalf of rural practitioners by Dr. WILLIAMS-FREEMAN (Hampshire), who said that his committee felt unable to take the responsibility of preventing the poorer practitioners from sending in their claims. A considerable number of village doctors could not make a net income of more than £500 a year for the simple reason that the patients did not exist. This was no matter of charity, and he was sure the junior members of the Civil Service did not consider themselves demeaned

by accepting a 10 per cent. bonus. Dr. BRACKENBURY said that if the course suggested in the resolution was decided on, it would be for the Insurance Acts Committee to make the general arrangements, but he hoped that that Committee would not have to deal with individual applications. While settling with the authorities what percentage was to be paid, it might be possible for the Committee to define a class of practitioners all of whom should be considered eligible for the grant; if not, it would be a case of each individual making his own application. The ordinary administrative method of payment would undoubtedly be through the Insurance Committees, but this was highly objectionable on all grounds, and an endeavour would be made to keep it a private transaction between the central Government department and the individual or class concerned. The CHAIRMAN added that there was a slight danger that if very few applied for this grant it would give a false impression to the Government; but if the resolution was carried, it would have to be made perfectly clear that there was a very strong objection on the part of many practitioners to making this appeal for what might be considered a dole, instead of a general increase in which all should share.

The motion was then put to the meeting and carried by a large majority.

Reconsideration of General Financial Contract.

Dr. BRACKENBURY then proposed (in lieu of a motion by Birkenhead, which was withdrawn in favour of this new motion):

That it is desirable at once to reconsider the methods of distribution of available funds as between area and area and between practitioner and practitioner, and thereafter to reconsider also the general financial arrangements and terms of service with a view to their settlement on an improved basis at the earliest convenient time.

He said that a full inquiry into the methods of distribution was an essential preliminary to the consideration of the general financial arrangements and terms of service.

Dr. WILLIAMS-FREEMAN wanted words added at the end of the motion which would make it necessary for the Committee to report progress and submit proposals at the next Conference. He said that to country practitioners the revision of terms of service was an urgent matter, and ought to be the subject of a special report. Since October a report of the Scottish Commissioners on the conditions of practice in Scotland had been forthcoming, and this showed that for every 100 insured persons 324 attendances were made in the counties and 310 in the burghs, and that the proportion of visits in the total of attendances was more than 50 per cent. in the counties and only 28.6 per cent. in the towns. He brought forward a number of other calculations reflecting the differences between town and country doctors, and said that rural practitioners would not wait indefinitely to have their grievances redressed, and the Insurance Acts Committee should report progress at the next Conference and receive instructions.

Dr. BRACKENBURY said that it was not necessary that the Committee should be specifically directed by the Conference to perform its elementary duty to report on the next occasion what it had done in this matter; and to direct it further to submit proposals, whether it was in a position to do so or not, was unreasonable. The investigation into the central pool, which had taken six months, was a simple matter compared with the whole question of distribution of funds, and thereafter of terms of service. The inquiry would occupy many months, and might not be sufficiently mature for proposals by the next Conference.

The motion was carried without the suggested addendum.

Collective Bargaining.

The action taken by the Committee to organize the profession, as instructed by the last Conference, then came under review, and Dr. BRACKENBURY pointed out that the scheme of collective bargaining had now been approved in a general form by the Conference of 1916, and in a more particularized form by the Conference of 1917. The first thing the Committee did after the last Conference was to discover how far it could rely upon the adherence of individual Panel Committees to the scheme. Some of the replies received had shown a misapprehension of what was intended. Certain committees had replied, for example,

that they could not favour any strike for the duration of the war; but that had nothing whatever to do with the question. There was no necessity to qualify a general adhesion by any such proviso. The scheme meant that the Committee on its part would report to the Panel Committees as often as possible, but it wanted to be assured that in any negotiations leading up to a possible fight at any time hereafter it was really backed up by the Panel Committees and the insurance practitioners in their areas. He hoped that the Panel Committees which had not exactly realized what was meant would see to it that at their next meeting they gave the assurances which were necessary.

Dr. F. COKE (Kent) thought that the requirement of 80 per cent. resignations was ridiculous, and rendered the scheme impracticable. Dr. STANCOMB said that the insertion of 80 per cent. was the deliberate act of the last Conference, and therefore it was not for them to criticize the Committee for embodying that figure in the statement; but the effective proportion of Panel Committees or individual practitioners varied with time and circumstances. He also asked for some guidance as to the financial basis upon which the proposed scheme would be carried through. In reply to these and other questions, Dr. BRACKENBURY said that the questions recently put to Panel Committees had nothing specifically to do with the present policy of asking for an increase in the capitation fee. The scheme of collective bargaining was accepted by the Conference against a small but powerful and insistent minority, and of course it was assumed that the representatives in the minority had their Panel Committees behind them in the attitude they adopted; but what the Committee wanted to know was whether, in view of the overwhelming vote of the Conference in accepting the collective bargaining scheme, this minority of Panel Committees would under the circumstances acquiesce in the position of the majority. He protested that there was nothing in the nature of a blank cheque in the scheme at all. It was an essential requirement of the scheme that throughout the negotiations the Panel Committees should be informed as to the course they were taking. He admitted that the scheme of collective bargaining was incomplete, but it involved consultation throughout with the Panel Committees. As to the financial question, it was an essential part of the scheme that the Insurance Acts Committee should raise a defence fund and act as trustees.

The Conference then gave its approval to the action taken by the Committee in this matter.

A Scottish motion was down on the paper affirming that Scottish practitioners would not hold themselves bound unless the 80 per cent. of panel practitioners referred to included 80 per cent. of the Scottish panel practitioners, and, further, that the question of resignation should be remitted to the Scottish subcommittee, who should deal directly with the Scottish Commissioners. The mover, Dr. T. WOOD (Leith), consented to withdraw the motion after Dr. J. R. DREVER (Glasgow), as Chairman of the Insurance Acts Subcommittee (Scotland), had promised that at a forthcoming conference of the Local Medical and Panel Committees of Scotland the matter would be considered, and possibly a *modus vivendi* arrived at.

The Organization of the Profession.

Dr. H. J. CARDALE (London) moved a resolution affirming the desirability that the British Medical Association should promote the formation of organizations definitely representing the interests of various sections of the profession and endeavour to establish a cordial relationship between itself and such organizations. He said that at the present time the panel profession was far from being properly coordinated, and in all negotiations carried through by the British Medical Association the difficulty had been that there was a large residue of panel practitioners who did not belong to the Association, and whose views were not obtained. He was anxious that the panel profession should be organized not only at the top but from the bottom upwards, and they wanted to obtain such organization not in opposition to the existing body but in cordial alliance with it.

Dr. MABEL RAMSAY (Plymouth) suggested that the British Medical Association itself should organize the panel profession by a system of greater decentralization than obtained at present. The country might be divided up into territorial areas, somewhat similar to the present

Branches and Divisions of the Association, with local secretaries, who in turn should organize their own particular areas and report to the Association. The motion was supported by Dr. LAURISTON SHAW (London), who said that it was impossible to secure collective bargaining on effective lines unless they were aware of the intended action of various sections of the profession, as, for example, the medical men on hospital staffs, and only by such sectional as well as local organization could the various interests be brought together and welded into a common whole. Dr. BRACKENBURY said that the Committee had never proceeded on the principle that everything should be done at the centre; the suggestion that there should be territorial groups came first from the Insurance Acts Committee itself, and, so far as the plan had proceeded up to the present, it was due to the Committee. The resolution which the Conference had passed in October, strongly deprecating the formation of new bodies, was as sound now as it was then. Multiplicity of organizations led to a dissipation of energy. The Committee included fifteen direct representatives of the Panel Committees themselves, hence it was idle to say that insurance practitioners were not represented, or that their views had not been obtained.

Dr. Cardale's motion was lost by a considerable majority, as was a further motion, by Dr. MODLIN (Sunderland) that six direct representatives of the Panel Medico-Political Union should be co-opted upon the Committee.

Increased Mileage Grant.

A further report by the Insurance Acts Committee was then submitted, on the action taken by the Committee in the matter of increased mileage allowance. Dr. BRACKENBURY regretted that the result of the Committee's efforts was so far unsatisfactory—as, indeed, was the whole basis of calculation—but in view of the war circumstances possibly no better result could be looked for. A number of rural representatives spoke on this subject, and one or two of them expressed regret that the Committee had accepted the Commissioners' method of distributing the new mileage grant, which method, they held, was contrary to the general interests of rural practitioners. Dr. LEWYS-LLOYD (Merionethshire) said that his county had secured since 1913 from the Welsh Commissioners a mileage grant for every person on the panel who lived three miles or more from the practitioner's residence. The Commissioners first offered his committee £320, as a sufficient sum to liquidate all mileage claims; but regarding this as wholly insufficient, the Committee took the trouble in 1913 to schedule every person living more than three miles from the practitioner, making an accurate measurement of the distance, and submitted this to the Commissioners, with the result that the grant was raised to £590, and was subsequently increased by the extra mileage allowance. Three counties in North Wales had followed this procedure and had succeeded in getting very good mileage grants. His committee wished the Insurance Acts Committee to accept its cordial thanks for their good work.

After a brief discussion on the report by the President of the Institute of Actuaries upon his investigation into the constitution of the central pool, which was approved, the Conference broke up, first passing a cordial vote of thanks to the Chairman of the Conference, the Chairman of the Insurance Acts Committee, and the officials of the Association, for their services in connexion with the Conference.

INQUIRY INTO CENTRAL POOL.

COPIES of the Report (M.29/1917-18) of Mr. S. G. Warner, President of the Institute of Actuaries, upon his investigation into the constitution of the Central Medical Pool will be supplied gratuitously upon application to the Medical Secretary.

Association Notices.

MEETING OF COUNCIL.

THE next Meeting of Council will be held on Wednesday, April 24th, in the Council Room, 429, Strand, London, W.C. 2., at 11 a.m.—By order,

April 18th, 1918.
W. E. WARNE,
Acting Secretary.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are announced by the Admiralty: Fleet Surgeons R. F. Parish to the *Pembroke*, additional, for Milton Mount Sick Quarters; A. I. Sheldon to the *Pembroke*, for R.N. Barracks; O. Rees to the *Wildfire*, additional, for Sheerness Barracks and Yard; A. J. Hewitt to the *Crescent*, additional, for Larbert R.N. Hospital; Staff Surgeon L. Warren, to the *Crescent*, additional for Larbert R.N. Hospital. Temporary Surgeons: F. N. Reynolds to the *Broke*; A. R. Hamilton to the *Pembroke*, additional, for Milton Mount Sick Quarters; R. W. Nesbitt to the *Victory*, for Haslar Hospital; W. P. Vicary to the *Woodwich*; E. E. Llewellyn to the *Monarch*; T. H. R. McKiernan to Plymouth Hospital; J. D. Brown to Haslar Hospital; A. Ritchie to Chatham Hospital.

ARMY MEDICAL SERVICE.

Temporary Lieut.-General Sir G. H. Makins, K.C.M.G., C.B., reverts to the temporary rank of Major-General on ceasing to be specially employed.

Major-General Sir William Babbie, V.C., K.C.M.G., C.B., to be Inspector of Medical Services, and to be temporary Lieut.-General, March 1st (Sir William Babbie's previous tenure of this office was in 1907-1910.)

Major-General Sir Francis H. Treherne, K.C.M.G., and Colonel L. T. M. Nash, C.M.G., are placed on retired pay.

Colonel James Thomson, C.B., to be temporary Major-General.

ROYAL ARMY MEDICAL CORPS.

Temporary Major (Captain R.A.M.C.T.F.) P. N. B. Odgers relinquishes his temporary commission on reposting.

Temporary Captains to be temporary Majors (without increased emoluments) whilst specially employed: W. Kennedy-Taylor, R. Semple.

Late temporary Captains granted honorary rank of Captain: R. P. McDonnell, S. J. Scott.

Temporary Lieutenants to be temporary Captains: A. S. Webber, S. Stockman, R. W. Greatorex, J. M. Glasse.

OVERSEAS CONTINGENTS.

CANADIAN ARMY MEDICAL SERVICE.

Colonel (temporary Surgeon-General) G. la F. Foster, C.B., to be temporary Major-General, seniority from February 9th 1917, but to continue to be paid as a Director of Medical Services, Canadian Forces, Assistant Director of Medical Services: Temporary Colonel C. F. Wyde, C.A.M.C., vice temporary Colonel J. A. Roberts, C.B., C.A.M.C.

Deputy Assistant Director of Medical Services: Temporary Captain (acting Major) F. V. Woodbury, C.A.M.C., and to retain his acting rank while so employed.

Temporary Captain (acting Major) M. H. Allen relinquishes his appointment and retains his acting rank while specially employed.

Temporary Lieut.-Colonel J. G. Adams to be temporary Colonel.

CANADIAN ARMY MEDICAL CORPS.

Temporary Lieut.-Colonel R. Raikes is seconded for duty with the Board of Pension Commissioners for Canada (British Branch) without pay and allowances.

CURRENT NOTES.

Meeting of Central Council.

THE quarterly meeting of the Central Council of the Association on April 24th was largely concerned with the consideration of the annual report and financial statement, as to which particulars will be published in later issues.

Election of President.

The Council decided to recommend the Representative Body to re-elect Sir T. Clifford Allbutt, K.C.B., M.D., F.R.S., to be President of the Association for the year 1918-19.

The late Mr. Guy Elliston.

Before proceeding to the ordinary business, the Chairman of Council, Dr. J. A. Macdonald, paid a tribute to the late Mr. Guy Elliston, Financial Secretary and Business Manager, who, he said, though perhaps not very well known to many members of the Association, was held in very high esteem by the officers of the Association who were brought into close contact with him. They had learnt to appreciate his sterling honesty and his devotion to the Association, and to conceive a great liking for him as a man. Major Lucas, Chairman of the Journal Committee, said that for the ten years during which he had been a member of that committee he had worked intimately with Mr. Elliston and had found his judgement unerring. By his death the Association had lost an able servant, whose capacity was really only known to members of the Journal Committee and the officers of the Association. As for himself, he had lost in Mr. Elliston a personal friend who could be relied upon in all difficulties. The Treasurer, Dr. Haslip, added a few words in his own name and in that of Dr. Rayner, the late treasurer, who had worked with Mr. Elliston for nine years. Dr. Rayner desired that his high appreciation of Mr. Elliston's abilities should be expressed, and Dr. Haslip added that only since he had himself been Treasurer had he become fully aware of the value of the officer the Association had lost. A resolution by the Chairman that a letter of sympathy should be addressed to Mr. Elliston's relatives, and that a record of his services should be put on the Minutes of the Council, was carried in silence, all the members standing.

The Stewart Prize.

On a recommendation contained in a report of the Science Committee, signed by Sir T. Clifford Allbutt, its chairman, it was decided that the Stewart Prize for 1918 should be awarded to Lieut.-Colonel Robert McCarrison, I.M.S., for his researches into the physiology and pathology of the thyroid gland and the parathyroid glands, and for the light he has thrown on the epidemiology of goitre. The prize was founded by Dr. Patrick Stewart, physician to the Middlesex Hospital, who was greatly interested throughout his life in epidemiology, and was one of the first to establish the distinction between typhus and typhoid fevers. He died in 1883. The object of the prize, which is administered under regulations adopted in 1880, is to afford recognition of important work already done or of researches instituted and promising good results regarding the origin, spread, and prevention of epidemic

disease, with the view of encouraging continuance of such researches. The prize was first awarded in 1882 to Surgeon-General Vandyke Carter, I.M.S., for his work in connexion with spirillum fever. It has since been awarded every second or third year. Among the recipients have been the late Dr. J. B. Russell of Glasgow, Professor Sims Woodhead, Sir Patrick Manson, Dr. F. W. Mott, Sir W. H. Power, Sir David Bruce, and Colonel W. H. Horrocks. Colonel McCarrison recently brought together the results of his observations and experiments on goitre in a book which was reviewed by Professor Adams in this JOURNAL on September 1st, 1917. The prize has usually taken the form of an illuminated certificate and a cheque for £50.

War Emergency Fund of the Royal Medical Benevolent Fund.

The following further subscriptions have been received from Divisions of the British Medical Association in response to the recent appeal, and have been passed on to the Treasurer of the War Emergency Fund. The names of individual subscribers are published monthly in the advertisement pages of the JOURNAL:

Newcastle-on-Tyne Division, per Dr. James Hudson, Hon. Sec.	£ s. d.
Mid-Staffordshire Division, per Dr. T. D. Stuart Shaw, Hon. Sec.	90 4 0
Leeds Division, per Dr. J. Allan, Hon. Sec. (two instalments)	37 9 0
Guildford Division, per Dr. H. F. Parker, Hon. Sec.	10 10 0

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are announced by the Admiralty: Staff Surgeon F. J. Gowans to the *Victory*. Temporary Surgeon D. J. Max to the *Harrier*; W. J. Jago to the *Royal Arthur*; R. C. P. Whitcombe to Malta Hospital; D. McM. Dickson, T. M. Payne, C. C. Beney, H. C. Apperley, E. A. Holmes, and C. W. Armstrong to Chatham Hospital; H. Millett, G. H. Sims, F. Caldecott, G. A. S. Shacklock, R. T. F. D. Roberts, and W. Gover to Haslar Hospital; H. T. Cubbon, F. B. Dutton, F. G. Wood, M. E. Jones, J. M. Higginton, W. A. Jolliffe, and D. M. Muir to Plymouth Hospital. To be temporary Surgeons: H. W. A. Hall, C. E. Cobb, W. A. Gray, N. B. de M. Greenstreet.

ROYAL NAVAL VOLUNTEER RESERVE.

Surgeon E. R. Sircorn to R.M. Division, Plymouth; Surgeon Probationers L. N. O'Neill to the *Beaver*; J. A. Kerr to the *Goshawk*; J. C. Souter to the *Forester*; J. A. Douglas to the *Hind*; D. H. Williams to the *Cockatrice*; H. I. Quinn to the *Teazer*; W. Dayle to the *Lennox*; C. M. Probert to the *Lucifer*. To be Surgeon Probationers: T. M. Jones, A. L. McGregor, R. G. McIntyre, G. L. Meachin, W. C. Wardle, J. Chrennell, A. L. G. Thompson, D. H. Williams, W. L. Grassick.

ARMY MEDICAL SERVICE.

To be temporary Colonels: Lieut.-Colonel E. B. Knox whilst employed as Assistant Director of Medical Services of a Division; John Herbert Parsons.

ROYAL ARMY MEDICAL CORPS.

Major A. C. Osburn, D.S.O., relinquishes the temporary rank of Lieut.-Colonel on reposting.

Temporary Major H. S. Raper is seconded for service under the Ministry of Munitions.

Majors W. Davis and A. W. Sempy relinquish the acting rank of Lieut.-Colonel on reposting.

To be acting Lieut.-Colonels whilst in command of a medical unit: Major R. P. Ellery, Captains T. W. Browne, A. J. A. Menzies, D.S.O., and J. C. Sproule.

Captain H. C. D. Rankin relinquishes the rank of acting Lieut.-Colonel on reposting.

Captain T. W. Browne relinquishes the acting rank of Lieut.-Colonel, and reverts to the acting rank of Major, with pay and allowances of his substantive rank.

P. C. Drew, late temporary Captain, is granted the honorary rank of Captain.

To be acting Majors:—Captains: P. J. Ryan, P. Phillips, M.C., C. H. Deayer, M.C., P. C. Lang, D.S.O. Temporary Captains: A. O. Bryson,

J. E. H. Roberts, R. B. Macfie, E. G. Stanley, H. C. Wilson, C. R. Macdonald, M.C., C. A. Bernard, J. Watson, R. S. Renton, J. W. McKinney, E. L. M. Hackett, H. G. Willis, M.C., C. F. Drew, E. C. Abraham, M.C., J. L. Menzies, M.C., A. R. Esler, J. S. Lewis, M.C., D. McI. Hunter, M.C., W. K. A. Richards, M.C., F. C. Greig, H. B. Graham, D.S.O., C. J. Sullivan, B. F. Bartlett, M.C., B. W. Armstrong, P. J. Lane, M.C., J. H. Hebb, G. E. Spicer, A. Massey, W. J. Macdonald, F. T. Rees, M.C., G. W. Riddell, J. Burke, G. W. Parry, M.C., H. F. Warwick, M.C., J. H. Porter, M.C., W. R. P. McNeight, J. Crawford, M.C., J. W. Linnell, H. W. Powell, C. L. Chalk, M.C., C. C. Forsyth, W. S. Martin, M.C., E. E. Herga, M.C., J. Rodger, W. A. Curry, J. W. Innes, Lieutenants (temporary Captains): R. Ellis, M.C., H. E. A. Boldero, W. K. Campbell, D.S.O., M.C., W. C. Harrill, M.C., R. Stowers, J. A. Andrews, M.C.

Temporary Lieutenant R. L. E. Downer to be temporary Captain.
Temporary honorary Lieutenants to be temporary honorary Captains: R. M. Dodson, F. B. Grinnell.
Temporary Lieutenant Vincent Joseph Cullen is dismissed the service by sentence of a general court-martial, February 11th, 1918.
Officers relinquish their commissions:—Temporary Captains: W. H. Allen (and is granted the honorary rank of Captain), L. E. Hertslet, D. C. Graham (on account of ill health, and is granted the honorary rank of Captain), E. R. Eatock (on account of ill health contracted on active service, and is granted the honorary rank of Captain), C. H. Denham, E. B. Morley, T. A. Jones, D. L. MacKenna (and is granted the honorary rank of Captain), T. J. J. Curran, H. A. Cates, E. C. Macanlay, M.C., R. L. Thornley (and is granted the honorary rank of Captain), P. Ache. Temporary Lieutenants: S. B. Couper, G. F. Visner, J. L. Green (on account of ill health contracted on active service, and is granted the honorary rank of Lieutenant), T. B. Mitchell (on account of ill health, and is granted the honorary rank of Lieutenant), B. F. Hynes, S. Blake, W. L. Tindle, R. Young, L. du Vergé, J. H. Ashworth, temporary honorary Lieutenant C. H. Evans.

ROYAL AIR FORCE.

Major-General R. C. Munday to be Medical Administrator, March 5th.
Lieut.-Colonel C. B. Heald to be Assistant Medical Administrator, April 1st.

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Captains to be acting Majors: F. Jefferson, W. A. Miller, D.S.O., M.C., I. M. Pirrie, M.C., R. A. Greenwood, J. C. Brash, M.C., G. A. Bridge, J. Rafter, M.C., S. J. Seward, D.S.O., R. H. Hodges, M.C., G. V. Stockdale, D.S.O., J. Purdie, M.C., W. B. Blore, R. P. Ballard, J. D. Proud, M.C., W. Barclay, M.C., W. B. Poschewaita, M.C., W. H. Ferguson, G. P. Kidd, A. A. Smalley, M.C., C. F. Burton, C. J. Rogers, M.C., J. P. Quinn, M.C., J. A. Fridham, M.C., C. E. H. Guter, R. Taylor, M.C., J. Stephenson, M.C., J. H. Bayley, M.C., G. H. C. Moid, F. G. Lescher, M.C., J. Swan, M.C., G. T. Van der Vijver, J. B. Cavenagh, M.C., A. J. Beveridge, M.C., F. J. Gethken, M.C., A. G. S. Wallace, M.C., E. J. Bradley, E. W. Williams, A. W. Russell, M.C., A. R. Hill, M.C.
Captain A. L. Shearwood to be acting Major whilst commanding a section of No. 34 Field Ambulance, January 4th, 1918, and to retain the acting rank of Major whilst commanding a section of No. 33 Field Ambulance.

Captain S. B. King relinquishes his commission on account of ill health.
Lieutenants to be Captains: E. ff. Creed, J. R. John, F. K. Haymon, G. E. Archer, J. B. Leigh, J. W. T. Thomas.

To be Lieutenants: D. J. A. Lewis, Second Lieutenant W. L. M. Gabriel from Unattached List T.F., J. Hope from Manchester University Contingent O.T.C., F. Walton from Leeds University Contingent O.T.C., D. M. Jones, A. Robertson.

TERRITORIAL FORCE.

ARMY MEDICAL SERVICE.

Lieut.-Colonel (temporary Colonel) W. M. Roodcroft, C.M.G., relinquishes his commission on account of ill health, and is granted the honorary rank of Colonel, with permission to wear the prescribed uniform (substituted for announcement which appeared in the *London Gazette* of March 9th).

Colonel C. P. Oliver, C.M.G., to be retired under the provisions of paragraph 116 T.F. Regulations, and is granted permission to retain his rank and wear the prescribed uniform.

ROYAL ARMY MEDICAL CORPS.

Major (temporary Lieut.-Col.) F. S. Hibbens to be Lieut.-Colonel.
Major (temporary Lieut.-Colonel) J. Mackinnon, D.S.O., is seconded whilst holding appointment as Assistant Director of Medical Services, and to be temporary Colonel whilst so employed.

Captain R. Armstrong is seconded whilst holding appointment as Deputy Assistant Director of Medical Services.

Captain (acting Lieut.-Colonel) A. C. Mallace reverts to the acting rank of Major on ceasing to command a field ambulance, January 18th, 1918 (substituted for announcement in the *London Gazette* of February 25th, 1918).

Officers restored to the establishment: Lieut.-Colonel (Brevet Colonel) T. Gowans, Captains M. J. Stewart, D. W. Hardy (on vacating appointment as Deputy Assistant Director of Medical Services), P. R. Wrigley, H. Mason, H. C. Snell, J. Broadley, J. Stokes, and F. V. Milburn.

Captain (temporary Major) H. F. Everett relinquishes his temporary rank on alteration in posting.

Captains seconded for duty with a general hospital: A. A. Pratt, H. B. W. Smith, J. B. Macalpine.

The notification on of the seconding of Captain W. N. King, which appeared in the *London Gazette* of March 25th, is cancelled.

Captain C. F. Coombs to be acting Major whilst commanding a section of a general hospital.

To be acting Majors whilst specially employed: Captains F. C. Chandler, A. M. Mackay, W. J. Purves, C. A. Webster, N. H. H. Haskins, H. E. S. Richards, W. R. Pierce, F. Hauxwell, J. C. Grieve, W. Stobie, R. G. Badenock, J. W. Craven, M.C., H. B. Low, H. N. Goode, A. Anderson, F. Ellis, M.C., E. C. Plummer, I. C. Marshall, C. P. Brentnall, D. H. Scott, C. F. M. Saut, F. A. Roper, T. J. Wright, W. A. Robertson, G. H. H. Mansfield, R. V. Favell, A. L. Yates, H. Henry, D. H. Weir, J. W. Anderson, M.C., O. K. Wright, E. N. Butler, D. G. Rice-Oxley, H. G. L. Haynes, P. T. Rutherford, R. P. Pollard, A. M. Hughes, J. M. Plews, F. Coleman, H. B. Dixon, M.C., M. T. Aecough, M.C., T. S. Elliot, C. B. Johnstone, T. E. A. Carr, H. P. Malcolm, M.C., J. S. Wallace, M.C., J. W. Dale, E. M. Corner, C. P. Lapage, A. C. Hepburn, R. C. Clarke, R. V. C. Ash, N. W. Kidston, F. H. C. Watson, H. H. Robinson, N. M. Fergusson, J. H. Jordan, J. F. Ediniston, J. S. McConnachie, M.B., J. M. Smith, J. H. Hunter, T. C.

Britton, H. Seddon, S. McCausland, M.C., R. D. Moore, M.C., F. Wigelesworth, C. N. Smith, M.C., H. Foxton, M.C., G. E. St. C. Stockwell, W. R. Allen, V.C., M.C., W. Sneddon, W. Scarisbrick, J. H. Lloyd, J. W. Thomson, R. Henry, C. W. P. Baldwin, H. T. Bates, R. G. Dixon, S. Scott, J. Morris, M.C., J. Strathearn.

Captain A. W. B. Loudon to be acting Lieut.-Colonel whilst specially employed.

Captains to be Majors: M. J. Mahony, February 6th, 1915 (substituted for announcement in the *London Gazette* of March 17th, 1915), C. B. Whitehead.

Captain H. J. Walker vacates the appointment of registrar.

Captain W. R. Wood is transferred to the permanent personnel.

Lieutenant E. A. Grogg relinquishes his commission on account of ill health.

VOLUNTEER FORCE.

Cornwall Volunteer Regiment, 1st Battalion.—A. J. Little to be Medical Officer and temporary Captain.

Cumberland Motor Volunteer Corps.—J. R. S. Anderson to be Medical Officer and temporary Captain.

City of Glasgow Volunteer Regiment, 1st Battalion.—J. H. Teacher (late Surgeon-Captain 1st Lanark R.E. Volunteers) to be Medical Officer and temporary Lieutenant.

Hampshire Medical Volunteer Corps.—Temporary Captain A. E. Clark relinquishes his commission.

Kent Medical Volunteer Corps.—Captain W. W. Linington (late R.A.M.C.) to be temporary Major. To be temporary Captains: E. L. N. Pidmore (late Captain 2nd Dorset Volunteer Artillery), S. A. E. Griffiths, F. E. Nichol, W. R. Brunton.

County of London Volunteer Regiment, 13th Battalion.—G. Pollock (late Captain R.A.M.C.) to be Medical Officer and temporary Captain.

Northumberland Medical Volunteer Corps.—C. G. Henderson to be temporary Captain.

Northumberland Motor Volunteer Corps.—H. B. W. Paige to be Medical Officer and temporary Captain.

Nottinghamshire Motor Volunteer Corps.—W. Hunter to be Medical Officer and temporary Lieutenant.

MATTERS REFERRED TO DIVISIONS.

British Medical Association.

ANNUAL REPRESENTATIVE MEETING,
LONDON, 1918.

THE Annual Representative Meeting of the Association will be held in London on Thursday, July 25th, and following day(s) as may be necessary.

Important Notice to Members.—Owing to the enforced restrictions in the size of the JOURNAL and its SUPPLEMENT, it will not be possible to publish therein the Annual Report of Council as in previous years. The Council has decided that the best way of meeting the difficulty is to print only the Financial Statement and Estimate (p. 48), and the Recommendations of the Report, forwarding the full Report to all Representatives of Constituencies, and Chairmen, Presidents, and Secretaries of Divisions and Branches. A copy of the full Report will be sent post free to every member who applies for it, and members are reminded that the number of Recommendations is no guide whatever to the number or importance of the matters dealt with in the Report. A list of the more important matters dealt with in the Report will be found on p. 49 of this SUPPLEMENT.

Honorary Secretaries are again reminded that Notices of Motion from Divisions and Branches for the Annual Representative Meeting, proposing to make any addition to or any amendment, alteration, or repeal of any Regulation or By-law, or to make any new Regulation or By-law, or proposing material alteration of the policy of the Association in matters relating to the honour and interests of the medical profession or of the Association (Art. 30, By-law 40), must be received by the Medical Secretary not later than May 16th, 1918. All such Notices of Motion received up to that date will be published in the SUPPLEMENT of May 25th.

(A) PRELIMINARY.

PRESIDENTSHIP, 1918-19.

Recommendation.—That Sir Thomas Clifford Allbutt, K.C.B., LL.D., F.R.S., be re-elected President of the Association for 1918-19.

(Para. 1 of Annual Report of Council.)

(B) FINANCE.

(Extracts from the Financial Statement are printed at p. 48.)

(D) ORGANIZATION.

GROUPING OF BRANCHES FOR ELECTION OF COUNCIL,
1919-20.

(i) Home Branches.

Recommendation A.—That the Home Branches be grouped for election of 24 members of Council, 1919-20, in the same way as for 1918-19.

(For the 1918-19 grouping see BRITISH MEDICAL JOURNAL SUPPLEMENT, May 8th, 1915, p. 201.)

(ii) Oversea Branches.

Recommendation B.—That the Oversea Branches be grouped for election of 7 members of Council, 1919-20, in the same way as for 1918-19.

(For the 1916-17 grouping see BRITISH MEDICAL JOURNAL SUPPLEMENT, May 8th, 1915, p. 202. The 1918-19 grouping was similar, except that the Grenada Branch was included in the Canada and West Indies Group.)

(Para. 47 of Report.)

(I) NATIONAL HEALTH INSURANCE.

CONSTITUTION OF INSURANCE ACTS COMMITTEE.

Recommendation.—That the Annual Representative Meeting, 1918, amend the Schedule to the By-laws as to the constitution (other than membership *ex officio*) of the Insurance Acts Committee to read as follows:

"Otherwise appointed.

Members of the Association appointed as follows:—

6 elected (in the manner prescribed by the Representative Body) by the elected Representatives of the Constituencies formed for the United Kingdom under By-law 33—namely, 4 by all the elected Representatives (acting together) of the Constituencies so formed for England and Wales, and one each by all the elected Representatives (acting together) of the Constituencies so formed for Scotland and for Ireland respectively;

22 elected by the 4 members *ex officio* and the above mentioned 6 elected members of the Committee acting together, such 22 members to be nominated or qualified as under—namely,

18 to be selected so far as possible on a territorial basis from among members nominated by the Local Medical Committees and Panel Committees formed in Great Britain under the Insurance Acts;

1 (being a member of the Staff of a Voluntary Hospital) to be nominated by the Hospitals Committee of the Association;

1 to be nominated by the Medical Women's Federation;

1 to be nominated by the Society of Medical Officers of Health;

1 to be nominated by the Poor Law Medical Officers' Association of England and Wales;

with power for the members appointed as above provided to co-opt as additional members such number (if any) of non-panel practitioners as shall be required to secure that 4 such practitioners shall be members of the Committee."

(Paras. 150-1 of Report.)

(K) HOSPITALS.

PAYMENT OF MEDICAL PRACTITIONERS FOR TREATMENT
OF DISCHARGED DISABLED SOLDIERS AND SAILORS
AT VOLUNTARY HOSPITALS.

Recommendation.—That where it is possible, without detriment to the claims of the civil population, to give hospital treatment, either as in- or out-patients, to discharged soldiers and sailors for whom a public authority is liable, a charge should invariably be made which shall repay the hospital for cost of working and maintenance, and that in addition £2 2s. per case treated, or alternatively a sum equal to 10 per cent. of the amount paid to the institution for working and maintenance expenses, should be put at the disposal of the medical staff.

(Paras. 149-56 of Report.)

By order,

ALFRED COX,

Medical Secretary.

May 1st, 1918.

British Medical Association.

Having examined the Balance Sheet, dated 31st December, 1917, and Accounts with the books and vouchers of the Association, except as regards the Irish Committee Account, and having received all the information and explanations we have required, we report that the Balance Sheet is, in our opinion, properly drawn up so as to exhibit a true and correct view of the state of the affairs of the Association according to the best of our information and the explanations given to us and as shown by the books of the Association.

We have verified the Investments of the Association on General Account and on account of the Trust Funds shown and of the Office Staff Superannuation Fund, and we have verified the possession by the Bankers of the Association of the Deeds of the Freehold Property.

G. E. HASLIP, M.D.,
Treasurer.

LIST OF THE MORE IMPORTANT MATTERS DEALT WITH IN THE ANNUAL REPORT OF THE COUNCIL, 1917-18.

(A) PRELIMINARY.

Presidentship, 1918-19.—Annual Meeting, 1918.

(B) FINANCE.

Balance sheet, December 31st, 1917; revenue and expenditure.—Apportionment of Subscription.

(C) CENTRAL MEDICAL WAR COMMITTEE.

Relationship with National Service Ministry.—Approaching end of supply of medical men for the Services.—Military Service Act, 1918.—Economy in military medical service.—Position of medical students.—Applications for demobilization.—Gratuities of Territorial officers demobilized on recommendation of Committee.—General demobilization.—Various Medical Boards.—Payment of medical officers of auxiliary hospitals.—Conditions of service of medical officers of Red Cross hospitals.

(D) ORGANIZATION.

Grouping for election of Council, 1919-20.—Grouping for election of Representative Body, 1918-19.—Membership.—Handbook of the Association.—Representation of medical profession in Parliament and on Government and Municipal Bodies.

(E) SCIENCE.

Scientific work of Divisions and Branches.—Increased lending library facilities.—Stewart Prize.

(F) MEDICAL ETHICS.

Position of practitioners examining patients of other practitioners.—Propriety of answering certain inquiries which the Local Government Board has directed should be made.

(H) MEDICO-POLITICAL.

Ministry of Health.—Education Bill.—Infant consultation centres for mothers.—Appointment of medical referees by Ministry of Pensions.—Medical Assessors in compensation actions.—Departmental Committee on the Care of the Blind.—State registration of nurses.—District nursing in London.—Cocaine and Opium Regulations.—Abuse of hypnotic and other drugs.—Medical practitioners and reduction of lighting, etc.—Order.—Reports on women seeking employment on munition work.—Medical certificates of incapacity for work of munition workers.—Lay persons and the practice of medical radiography.—Venereal disease.—Repair of and spare parts for doctors' motor cars.—Supply and price of petrol.—Supply of carbide for motor head lamps.—Medical fees for private practice.—Payment of medical practitioners called in on the advice of midwives.—Proposals for a State-aided Midwifery Service.—Fees for notification of infectious disease.—War Emergency Fund of Royal Medical Benevolent Fund.—Belgian Doctors' and Pharmacists' Relief Fund.—Conditions of dental practice.

(I) NATIONAL HEALTH INSURANCE.

Constitution of Insurance Acts Committee.—Reports to Conferences and to Representative Body, as to action taken.—Annual and Special Conferences of Representatives of Local Medical and Panel Committees, October, 1917, and April, 1918.—Local Conferences of Local Medical and Panel Committees.—Scottish Subcommittee.—Invitation to Association to appoint a member of the Council of the Faculty of Insurance.—Future of Insurance practice.—Non-Panel Committee.—Ministry of Health.—Results of National Health Insurance Acts.

(J) PUBLIC HEALTH AND POOR LAW.

Question of permanent appointment of medical officers of health.—Uniform form for notification of infectious disease.—Irish Poor Law medical officers and membership of Irish County Councils.—Co-operation between the Association, Poor Law medical officers, and medical officers of health.

(K) HOSPITALS.

Payment of medical practitioners for treatment of discharged disabled soldiers and sailors at voluntary hospitals.—Staffing of venereal clinics.—Fees for medical attendance on paying patients at hospitals.

(L) NAVAL AND MILITARY.

Promotion and pay of officers of R.A.M.C. Territorial Force, and Special Reserve.—Indian Medical Service.—Senior officers in the Indian Medical Service.—Indian Defence Force Act, 1917, and non-official medical practitioners in India.—Payment of military medical officers in charge of special hospitals and departments.

(M) SCOTLAND.

Scottish Medical Service Emergency Committee.—Ministry of Health.—Education (Scotland) Bill.—Question of increase of medical fees.

(N) IRELAND.

Extra duties of medical officers of health under schemes for maternity and child welfare.—Poor Law medical officers' salaries.—Treatment of discharged disabled soldiers.—Maternity and child welfare.—Irish Medical War Committee.—Irish Medical Committee.

(O) OVERSEA BRANCHES.

Relationship between Oversea bodies and parent Association.—Functions of South African Committee.

Association Notices.

ANNUAL GENERAL MEETING.

NOTICE is hereby given by the Council that the Annual General Meeting of the British Medical Association will be held at the Connaught Rooms, Great Queen Street, London, W.C., on Friday, July 26th, 1918, at 2 o'clock in the afternoon. Business: (1) Minutes of last meeting. (2) Appointment of auditors (Messrs. Price, Waterhouse and Co., offer themselves for re-election). (3) Award of Stewart Prize. (4) Report election of President.—By Order,

W. E. WARNE, *Acting Secretary.*

May 4th, 1918.

ELECTION OF COUNCIL, 1918-19.

NOTICE is hereby given that nominations for candidates for election as Members of Council by Branches or Groups of Branches in the United Kingdom for the year 1918-19 must be forwarded to reach the Acting Secretary, at the Office of the Association, not later than Saturday, May 18th, 1918. Each nomination must be on the prescribed form, copies of which will be furnished by him upon application.

Separate forms have been prepared:

- For a nomination by a Division, and
- For a nomination by any three Members of a Branch respectively.

Those applying are requested to state for which purpose the form is desired.

An announcement of the Nominations received will be made in the JOURNAL of May 25th.

Election will be by voting papers. These papers will contain the names of all duly nominated candidates, and will be issued from the Central Office on Saturday, June 8th, and will be returnable not later than Saturday, June 15th.

The result of the election of Members to the Council will be published in the JOURNAL of June 22nd, or, in the event of there being no contests, earlier.

By Order of the Council,

W. E. WARNE, *Acting Secretary.*

May 4th, 1918.

GRANTS IN AID OF SCIENTIFIC RESEARCH.

THE Council of the British Medical Association is prepared to receive applications for grants in aid of scientific research into the causation, treatment, or prevention of disease. Preference will be given to medical practitioners and to applicants who propose to investigate the problems directly related to practical medicine.

Applications for grants for the year 1918-19 must be received not later than June 15th, 1918, and must be made on the prescribed form, which, together with the regulations governing the suggested grants, can be obtained on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

BRANCH AND DIVISION MEETINGS TO BE HELD.

SOUTHERN BRANCH.—Mr. James Green (Honorary Secretary) gives notice that the Branch Council at its next meeting will nominate candidates for the following offices for the ensuing year, namely, the President-elect, two Vice-Presidents, the Honorary Secretary, and the Honorary Treasurer, but that he is prepared to receive nominations, in writing, from any three members of the Branch for any such office on or before June 1st.

INQUIRY INTO CENTRAL POOL.

THE following further contributions have been received from Panel Committees towards the cost of the inquiry undertaken by the Insurance Acts Committee into the constitution of the Central Pool:

	£	s.	d.

Worcester Panel Committee	...	1	0

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty: Temporary Surgeons H. W. Breese and G. O. Grant to Chatham Hospital, C. E. E. Herington and W. Whitfield to Haslar Hospital, J. S. L. Roberts and S. O. Rashbrook to Plymouth Hospital, W. S. Lynd to the *Vernon*. To be temporary Surgeons: E. V. Corry, A. S. Green, T. W. Carstairs, T. W. Evans.

ROYAL NAVAL VOLUNTEER RESERVE.

To be Surgeon Probationers: G. W. Chester, W. Davie, F. F. Peterson, J. Hirschmann, G. R. Falcon, H. W. Southgate.

ARMY MEDICAL SERVICE.

Colonel C. O. Reilly, C.B., is retained on the active list under the provisions of Articles 120 and 522 Royal Warrant for pay and promotion, and to be supernumerary.

Colonel W. H. Starr, C.M.G., is placed on retired pay.

ROYAL ARMY MEDICAL CORPS.

To be temporary Majors: J. G. Fitzgerald, H. Pritchard, M. B. Scott, Captain J. R. R. Trist, M.C., to be acting Lieut.-Colonel whilst in command of a medical unit.

Temporary Captain S. L. Hinda to be temporary Major (without increased emoluments).

The notifications in the *London Gazette* of March 27th and April 4th regarding temporary Captain G. J. Arnold and temporary Lieutenant R. G. Hill respectively are cancelled.

The name of temporary Captain John Norman Cruickshank is as now described, and not as in the *London Gazette* of June 7th, 1916, and May 30th, 1917.

W. C. W. Glenny and A. B. Jones, late temporary Captains, are granted the honorary rank of Captain.

Lieutenants (temporary Captains) to be Captains: D. Pottinger, M.C., A. L. Robb, D. Bell, M.C., E. Catford, A. F. I. Patterson, D.S.O., C. J. D. May, D. G. Cheyne, P. A. Opie, F. P. Rankin, W. C. Hartgill, M.C., T. F. Kennedy.

Temporary Lieutenants to be temporary Captains: R. D. Passey, M.C., I. C. Edwards.

To be temporary Captains: A. R. O. Milton, Captain J. S. Pearson (from general list), H. A. Cutler, S. Potter, M. Foulkes, W. Allan, H. A. Treadgold, A. G. Henderson, E. Gordon, M.C., A. Burton, H. A. Fenton, H. N. M. Puckle, J. Bain.

The name of temporary Lieutenant James Stewart Soutter is as now described and not as in the *London Gazette* of May 21st, 1917.

Officers relinquish their commissions: Temporary Major L. S. T. Burrell (on ceasing to be employed at the County of Middlesex War Hospital). Temporary Captains: F. O. Stohr, (acting Major) G. H. Clark (substituted for notification in the *London Gazette* of March 9th), G. A. Birnie, W. D. Bathgate, S. S. Depree, E. E. Willis, H. H. Fairfax, W. R. White-Cooper. Temporary Lieutenants: A. C. Johnson and G. E. P. Davis (on account of ill health contracted on active service and are granted the honorary rank of Lieutenant). J. Acomb, R. J. Dick, A. W. Laing, H. C. W. Wood, W. B. Douglas-Drummond.

To be temporary Lieutenants: C. I. McLaron, J. D. McKelvie, A. A. Hall, J. M. Smith, G. Maclean, J. F. Paul, E. Goffon, W. S. Perrin, H. Farncombe, J. F. Jennings, L. D. Stephen, S. E. Murray, J. C. Curtis, T. G. Rothwell, F. J. Fox, A. L. Vaughan, H. Menage, R. L. Hughes, C. S. Macaskie, P. W. Ashmore, R. H. Martin, S. F. Boyle, H. J. Knox, S. Broderick, W. H. Ross, F. J. Gordon, E. Clark, J. J. Hughes, R. S. Harrington, H. N. Crossley, H. D. Pollard, P. B. Whittington, C. T. Costello, C. W. Coghlan, J. Menzies, G. de P. D'Amico, A. N. Symons, S. G. Trail, E. J. Budd-Budd, A. L. White, W. M. Johnston, S. P. Hyam, T. A. Matthews, E. Reavley, E. C. Tatam, F. M. H. Sanderson.

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Lieutenants to be Captains: A. Black, T. G. Roche, N. S. Tirard, T. D. Watt, J. S. B. Forbes, G. R. McRobert, T. H. Rhy, J. C. Burke, V. T. B. Yule, A. G. Lumsden, R. Lloyd-Jones, W. Christopher.

To be Lieutenants: G. V. W. Anderson, P. F. Bishop, O. B. Cohen, W. Feldman, R. B. Green, W. M. Heald, A. V. Pegge, B. B. Sharp, A. G. Shurlock, and G. K. Stone, from University of London Contingent O.T.C.; J. Chanley, J. C. T. Fiddes, and R. S. Paterson from Manchester University Contingent O.T.C.; F. W. M. Lamb from Birmingham University Contingent O.T.C.; H. S. Carter from Leeds University Contingent O.T.C.; E. R. Batho, A. E. Clark-Kennedy, W. S. Gross, R. M. Humphreys, J. W. Jones, P. M. Neighbour, M. C. Paterson, W. N. Goldschmidt, H. E. Bamber.

OVERSEAS CONTINGENTS.

CANADIAN ARMY MEDICAL SERVICE.

Deputy Director of Medical Services: Temporary Colonel J. A. Roberts, C.B., C.A.M.C.

Assistant Director of Medical Services: Temporary Lieut.-Colonel C. H. Dickson, D.S.O., C.A.M.C.

Deputy Assistant Directors of Medical Services: Temporary Major W. F. Nicholson, M.C., C.A.M.C.; temporary Major C. A. Young, C.A.M.C., relinquishes his appointment.

CANADIAN ARMY MEDICAL CORPS.

Temporary Captain (acting Major) M. M. Crawford relinquishes the acting rank of Major on ceasing to be specially employed.

Temporary Captains to be temporary Majors: (Acting Major) W. T. Ewing, J. E. McAskill, M.C., O. S. Waugh.

Temporary Captains to be acting Majors: F. C. Clarke, W. G. Cosbie, M.C.

Temporary Major E. R. Selly to be acting Lieutenant-Colonel, and to command a field ambulance.

Temporary Major J. H. Wood to be acting Lieutenant-Colonel.

Temporary Lieut.-Colonel L. E. W. Irving, D.S.O., to be acting Colonel whilst specially employed.

Temporary Captains (acting Majors) to be temporary Majors: R. J. Gardiner, M.C., G. W. Hall, and H. W. McGill, M.C. (substituted for notification in the *London Gazette* of March 8th, incorrectly describing the rank of these officers as Captains only).

Temporary Captain W. S. Macdonell to be acting Major while specially employed.

Temporary Captain (acting Major) W. J. Enright relinquishes the acting rank of Major.

A. B. Gordon to be temporary Captain.

Temporary Lieutenant J. A. Dickie is seconded for duty with the R.F.C.

Temporary Lieutenants to be temporary Captains: J. McW. McDonald, W. I. Henderson, O. A. Rae, J. E. Gimby, I. N. Mitchell, J. H. Macdonald, F. J. Elkerton.

SOUTH AFRICAN MEDICAL CORPS.

Temporary Lieutenants to be temporary Captains (without increasing emoluments): G. A. Beyers, C. F. Beyera, J. T. McAuslin, G. R. Cowie, P. A. Smuts, A. O. I. Brownlee.

Temporary Lieutenant H. Sterne-Howitt to be temporary Captain, with seniority next above G. A. Beyers.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Captains to be Majors: J. H. H. Pirie (and to remain seconded), P. Howie, L. C. V. Bardwick, A. B. Sloan.

Captain (temporary Major) T. S. Allan to be acting Lieut.-Colonel whilst commanding a general hospital.

Captain (acting Major) E. A. C. Fazan, M.C., relinquishes his acting rank on alteration in posting.

Captains to be acting Majors whilst specially employed: H. B. Pope, J. H. Blackburn, M.C., W. T. D. Mart, H. Drummond, F. Darlow, M.O., G. L. K. Pringle, H. Drummond, G. E. G. Mackay, M.C., W. L. Robertson, M.C., G. W. Greene, O. H. J. Fagan.

Officers restored to the establishment: Captain (temporary Major) J. Tait (December 31st, 1917), Captains J. B. F. Wilson, and F. Alcock.

Captains P. N. B. Odgers and I. G. Black are seconded.

Officers relinquish their commissions: Captains G. Thomson on account of ill health and is granted the honorary rank of Captain, F. P. Sturm and J. E. S. Smith on account of ill health contracted on active service and are granted the honorary rank of Captain.

Sergeant G. M. Till to be Lieutenant.

TERRITORIAL FORCE RESERVE.

Lieut.-Colonel R. Kirk, from R.A.M.C., to be Lieut.-Colonel.

Captain D. W. Hardy, from a field ambulance, to be Captain.

British Medical Association.

CURRENT NOTES.

A Ministry of Health.

THE British Medical Association has issued an explanatory pamphlet¹ setting out the reasons which have led the medical profession to support the establishment of a Ministry of Health, together with the revised scheme approved by the Council on January 23rd, 1918, and a general account of the arrangements suggested therein. After a short historical summary the nature of the problem is indicated by an enumeration of the many central departments and local authorities in England and Wales now more or less directly concerned with the administration of health legislation. To give point to the complexity of the existing arrangements for the treatment of the individual, an extreme case is taken illustrating the large number of medical practitioners, responsible to almost as many authorities, who might conceivably attend the members of a single poor family, apart from diverse forms of institutional treatment. In presenting its case for unification of authority and simplification of procedure, the Association lays stress on the importance of utilizing the family doctor in domiciliary treatment of every kind. With regard to institutional care, the value of the voluntary hospital system is insisted upon, though it is recognized that modifications may be inevitable in the near future. A possible solution of some difficulties might consist in a large extension of the cottage hospital idea, which allows the family doctor to follow his patients to the hospital, with benefit to all concerned. Under the head of "local administration" the arguments are given for dealing with this problem side by side with unification of central administration. Lastly, the relation of the medical profession to the administrative arrangements proposed in the Association's scheme is discussed with special emphasis on the need for organizing the clinical service on the lines of private practice, in order to maintain the personal relationship and freedom of choice on both sides which are necessary for successful treatment. The proposed system rests on the principle that every kind of treatment for the cure or alleviation of disease should be available for all who need it, and that every class of practitioner should be brought into the medical service. While recognizing that the problem is far from simple, the Association submits its scheme as a contribution to the public discussion which it is hoped will soon result in the setting up of an effective Ministry of Health. The pamphlet is accordingly being sent not only to the chairmen and secretaries of Divisions and Branches, and of Local Medical and Panel Committees, to the members of the General Medical Council, and the heads of various professional bodies, but also to officials of the Government departments concerned, to municipal Poor Law and local bodies, to members of both Houses of Parliament, and other public men interested in the matter, and to the lay press.

The Education Bill.

When the Education Bill was introduced into Parliament last autumn, the British Medical Association issued a memorandum to its members drawing attention to the proposals contained in Clauses 18 and 19, which, if enacted,

¹ A Ministry of Health. London: 429, Strand, W.C.2: pp. 16. 3d.

would extend the power of local education authorities to provide medical treatment as well as medical inspection for all children and young persons between the ages of 2 and 18. The objections of the medical profession to these clauses were placed before the President of the Board of Education by a deputation on December 14th, 1917.¹ Notwithstanding this protest the bill has now been reintroduced with Clauses 18 and 19 unchanged. The Council of the Association, on January 23rd, resolved to press for the deletion of Clause 18, or, failing that, to urge that the new powers and duties given to local education authorities should be confined to medical inspection. The policy of the Association in this matter is to secure the position of the private practitioner in the treatment of school children, and to oppose an extension of the system of whole-time medical officers appointed to perform duties well within the competence of local practitioners. It should be added that the Parliamentary Subcommittee in its efforts at the centre has had the advantage of consultation with four members of Parliament known to be in sympathy with the views of the profession, namely, Sir Watson Cheyne, Sir Henry Craik, Sir Philip Magnus, and Sir Garrod Thomas. By agreement Sir P. Magnus will move *inter alia* for the exclusion of the words "and treatment" from Clause 18. If carried, this will have the effect of limiting the provisions of those clauses to medical inspection only, thereby excluding the proposed extension of the power to provide medical treatment. Secretaries of Divisions and Branches have been asked to approach their members of Parliament at once and ask them to support Sir P. Magnus's amendment and have been provided with a further memorandum which explains the position taken up by the Association.

IRISH COMMITTEE.

A MEETING of the Irish Committee was held at the Irish offices, 16, South Frederick Street, Dublin, on April 4th, with Dr. Giusani in the chair.

Domiciliary Treatment of Discharged and Disabled Soldiers.

The Irish Medical Secretary stated that a representative of the Ministry of Pensions attended a conference between the Medical Commissioners of the Irish Local Government Board, the Irish Insurance Commission, and representatives of the Irish medical profession, with regard to the treatment of disabled and discharged soldiers and sailors.

After discussion of various proposals as to medical treatment for disabled and discharged soldiers and sailors and its remuneration, the medical representatives agreed to submit for the consideration of the Irish Medical Committee the following terms of remuneration on a capitation basis to include the supply of medicine: In urban areas 12s. 6d., in rural areas 15s.; the payment for certification under the Insurance Act to be extra—namely, in borough and larger urban areas 1s. 3d., urban-rural areas 2s., and rural areas 2s. 6d. per capita.

The committee considered these terms satisfactory, but suggested that the scheme should be sufficiently elastic to be adapted to the circumstances of the profession in different areas throughout the country.

Poor Law Medical Officers' Salaries.

The Committee considered the position of the Enniskillen Poor Law medical officers, and directed the Irish Medical Secretary to give every possible assistance to them in their struggle with the board of guardians for adequate salaries. The Committee was also of opinion that the Local Government Board should exercise its

¹ SUPPLEMENT, February 16th, 1918.

powers, and fix forthwith in this and other unions adequate salaries for Poor Law medical officers.

After consideration of complaints from members of the Association in different parts of Ireland, the committee directed its Medical Secretary to write to the Local Government Board urging that when graded scales of salaries are passed after the usual procedure by boards of guardians, and when they are accepted by the medical officers concerned, the Board should sanction them with the least possible delay. The committee also pressed the Local Government Board to sanction and urge boards of guardians to adopt a maximum salary of at least £300 per annum, to be retrospectively applied and attained after ten or fifteen years' service. This request was supported by the following arguments among others:

1. That the maximum salary is very little more than the working expenses of the majority of dispensary districts in Ireland.
2. That it is only by a gross abuse of the Medical Charities Acts that wage-earners and their employers are relieved from contributing towards medical benefits under the Insurance Act as applied to Ireland.
3. In boroughs and the larger urban areas Poor Law medical officers have not sufficient time, when they have discharged their official duties, to compete for a remunerative practice.

Meetings of Branches and Divisions.

SUSSEX BRANCH: BRIGHTON DIVISION.

A MEETING of the Brighton Division was held on April 25th. Deep regret was expressed at the untimely death of Mr. Guy Elliston, Financial Secretary and Business Manager of the Association, and recognition of his valuable services found utterance. The SECRETARY reported that 223 copies of a circular with respect to the proposal to increase medical fees had been sent out and 70 answers had been received; 55 were in favour of the increase—some few expressing uncertainty as to its amount—and 5 more or less completely objected. It was resolved that the principle of the increase of medical fees be approved, that the members of the profession in the area be advised to act in accordance with the suggestion made, and that the local press be approached with a request to announce this decision. With regard to the scheme for a State Medical Service, proposed by a special committee and approved at a meeting of the local profession held on February 23th, the HONORARY SECRETARY, as requested, presented a digest showing the difference between that scheme and one proposed by the Council of the Association. After discussion it was resolved:

That the Division concurs in the opinion expressed by the general meeting of the profession held on February 23th, 1918, and commends the proposed scheme to the Council of the British Medical Association for their consideration and support; and that the Executive Committee be requested to bring these proposals before the annual meeting of the Division with a view to instructing their representative.

Naval and Military Appointments.

ARMY MEDICAL SERVICE.

Colonels to be Major-Generals: (Temporary Major-General) O. R. A. Julian, C.B., C.M.G., vice Major-General F. J. Jencken, retired; S. McDonald, C.M.G., vice Major-General H. G. Hathaway, retired; (Temporary Major-General) M. P. C. Holt, K.C.M.G., C.B., D.S.O., vice Major-General Sir F. H. Treherne, K.C.M.G., retired.

Lieut.-Colonel (Temporary Colonel) J. D. Alexander, D.S.O., from R.A.M.C., to be Colonel, December 26th, 1917.

ROYAL ARMY MEDICAL CORPS.

Brevet Colonel H. A. Haynes is placed on retired pay. Temporary Captain C. R. Macleod, M.C., relinquishes the acting rank of Major on reposting.

To beacting Majors: Captains J. Rowe, N. T. Whitehead, M. C. R. A. Flood. Temporary Captains H. A. Lake, T. B. Batchelor, H. Moore, M. C., A. W. Rattrie, H. B. German, M. C., F. C. Lees, A. Richmond, M. C., A. F. Mavety (from January 4th to 29th, 1918), C. B. Davies, M. C., F. J. O. King, D. M. Morrison, G. T. Baker (from January 4th to 15th, 1918), F. T. Fahy, A. R. Finn (from January 4th to February 9th, 1918), W. A. Hislop (from February 23rd to March 1st, 1918), A. P. Fry (from January 4th to February 15th, 1918), C. A. Lloyd, J. E. P. Allen, V. M. R. R. B. Rutherford, W. C. Douglass, W. J. Morgan, W. S. Danks, J. Gibson, V. L. Connolly, M. C., J. B. Lowe, J. E. Davies, W. T. Brown, M. C., G. D. R. Carr, M. C., J. F. Robertson, A. S. K. Anderson, D.S.O., M. C., H. Young, H. H. Sampson, M. C., J. Anderson, D.S.O., S. J. Rowntree, W. Rankin, F. B. Manser, J. D. Hart, M. C., A. Mearns, H. W. Batchelor, B. H. Barton, M. C., H. H. Warren, H. R. Grellet, H. M. Vickers, G. Buchanan, W. J. C. B. Wishart, D. S. Brough, M. C., F. H. McCaughey (from January 4th to February 15th, 1918), R. C. Irvine, R. M. Greig, S. Cross (from January 4th to March 3th, 1918), P. Carney, A. Sunderland, F. de S. McManis, J. A. Doull, R. Svensson, H. W. Turner, M. A. Power, M. C., J. B. Haycraft, J. S. Arkle, R. C. Alexander, A. Charles, T. C. Ritchie, W. G. Munford, Donaldson, J. B. Cook, R. M. C. R. T. Worthington, T. I. Bennett, A. G. Hamilton, F. G. Bell, M. C., R. T. Worthington, T. I. Bennett, H. W. Scavin, S. G. Luker, Lieutenants (Temporary Captains) G. A. E. Argo, H. A. Harbinson, M. C., H. A. Rowell, M. C., R. J. Clausen, M. O. Temporary Lieutenant H. Goodman.

Officers relinquish their commissions: Temporary Captains F. L. Wood, E. D. Richardson, and A. Stevenson (on account of ill health, and are granted the honorary rank of Captain), W. G. Weston, and A. D. Bigland (on account of ill health contracted on active service, and are granted the honorary rank of Captain), G. O. Anglin, on account of ill health, September 20th, 1917 (substituted for notification in the *London Gazette* of September 21st, 1917), J. Ross, F. G. Thomson, H. N. Rankin, D. Wilson, J. S. Ross, M. Ramsay, H. G. Brown, J. Marmion, L. McL. Weeks, M. O., J. H. Waterhouse, E. S. Gooddy, B. Wallace, M. Moran, W. O. Welby, H. Hannigan, G. N. Lorimer, M. O., H. M. Harrison, J. S. Annandale, A. Hendry, J. M. O'Reilly, T. J. Buckley, J. K. Watson, G. F. Forde, N. W. Walmesley, V. J. McAllister, J. H. Wilkison, R. Slaney, A. J. Smith, C. McShane, R. P. Smith, H. McLean, J. F. Sadleir, W. M. McLaren, J. A. Hutchinson, R. C. Brown, N. G. Harry, T. MacHardy, R. McL. Veitch, on appointment under the Ministry of National Service, December 4th, 1917 (substituted for notification in the *London Gazette* of January 4th, 1918). Temporary Lieutenants D. Lynch, M. A. Teale, A. Bevan, A. W. G. Clark, A. W. M. Sutherland, L. J. Spence, F. W. Hartley, F. J. Lawson, R. J. Maglion, A. A. Wilkinson, S. M. Wilcox, C. F. Hardie, A. Densham, R. T. Edwards (on account of ill health, and is granted the honorary rank of Lieutenant), T. E. A. Stowell.

INDIAN MEDICAL SERVICE.

Lieut.-Colonel P. P. Kilkelly, Presidency Surgeon, Western States of Rajputana, has been appointed temporarily to hold charge of the current duties of the office of the Resident, Western Rajputana States, with effect from September 25th, 1917.

Lieut.-Colonel W. W. Clemesha, M.D., has been granted the rank of temporary Colonel whilst employed as an Assistant Director Medical Services.

Major J. N. Walker to officiate as Professor of Medicine, King George's Medical College, Lucknow.

Lieut.-Colonel C. R. Stevens to officiate as Professor of Surgery, Medical College, Calcutta, and Surgeon to the College Hospital.

The promotion to present rank of the undermentioned officers is antedated as shown: Majors W. M. Pearson (July 23th, 1910); W. E. McKechnie (Jan. 1st, 1911); A. Spitteler (December 28th, 1911); N. S. Wells (July 29th, 1912); J. K. S. Fleming, E. C. Hepper, C. B. McConaghy, L. P. Brassey, and O. F. Marr (December 27th, 1912); S. H. Lee Abbott, B. J. Bradley, J. W. McCoy, T. G. F. Paterson, and D. G. Rai (July 29th, 1913); A. J. V. Betts, B. B. Paymaster, J. Forrest, and D. S. A. O'Keefe (January 26th, 1914); V. B. Nesfield, G. A. Jolly, C. E. Bulteel, and F. C. Rogers (March 1st, 1914); C. G. Seymour (July 31st, 1914); G. W. Maconachie, O. I. Brierley, and E. T. Harris (February 23th, 1915); H. Watts, W. T. McCowan, and E. A. Roberts (July 30th, 1915); H. S. Matson, P. H. Stewart, A. H. Proctor, R. T. Wells, I. M. Macrae, and F. B. Shettle (March 1st, 1916); A. F. Hamilton and A. A. McNeight (August 1st, 1916).

Appointed permanently as Lieutenants: B. C. Ashton, J. G. Bird, W. M. Crombie, R. Hay, G. A. S. Ramsey, and G. Shanks (January 23rd, 1917). N. Briggs and P. Verdon (August 8th, 1917).

To be temporary Lieutenants: Khuda Baksh, Parmanand, Kanan Bihari Sen Roy, Gopal Charan Sen, Leonard J. P. Mordaunt, Bulchad Batanmal Malkani, Khesat Chandra Bhattacharya, Oyiti Churia Madhavan, Sista Lakshminathi Somayaji.

Major J. M. Holmes, M.B., has been appointed Health Officer, notified area, Delhi.

Major H. Crossie has been posted as Joint Civil Surgeon, Peshawar, with effect from October 15th, 1917.

APPOINTMENTS.

STRATON, A. W. K., M.R.C.S., L.R.C.P.Lond., Certifying Factory Surgeon for the Wilton District, Co. Wilts.

THORNTLEY, R. L., M.D.Lond., D.P.H., County Medical Officer of Health to the East Riding of Yorkshire.

YOUNG, Robert Arthur, M.D., F.R.C.P., Physician to the Middlesex Hospital, vice Dr. F. J. Wethered, resigned.

DISTRICT MEDICAL OFFICERS.—J. Bradley, L.R.C.P.I., of the Salford Union. F. Dover, M.B., B.S.Durh., of the Cardiff Union. H. Litherland, L.S.A., (and Workhouse) of the Wigau Union.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 6s., which sum should be forwarded with the notice not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

BIRTH.

JAMES.—On May 2nd at Hungerford, Berks, the wife of R. Blake James, M.R.C.S.Eng., L.R.C.P.Lond., of a daughter.

DEATHS.

BLADES.—On April 22nd, at the Beeches, Bonmley, Cheshire, T. P. Blades, L.R.C.S.

HUNT.—Major T. Harold Hunt, R.A.M.C.(T.), M.D., R.S.Lond., of Halifax, Yorks, on April 29th, rather suddenly, from acute pneumonia.

DIARY FOR THE WEEK.

MONDAY.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W.1.—8 p.m., Annual Meeting, 8.30 p.m., Annual Oration by Dr. Theo. B. Hyslop, F.R.S.E., on Degeneration: The Medico-Psychological Aspects of Modern Art, Music, Literature, Science, and Religion.

FRIDAY.

CURRENT NOTES.

Medical Examination of Women seeking Employment in Munition Factories.

In February, 1917, the Association represented to the Ministry of Munitions that the fee for the medical examination of women seeking employment in munition areas should be 5s. per case instead of the fee of 2s. 6d. which was being offered, but which the Association considered inadequate, having regard to the importance of the work and the elaborate nature of the form to be filled in. In reply, the Association was informed that the fee of 2s. 6d. had been fixed after consultation with the medical advisers to the Ministry, and that no difficulty had been experienced in obtaining the desired medical services on those terms. Subsequently, representatives of the Association were invited to discuss the question with representatives of the Employment Department, and the Welfare and Health Section of the Ministry of Munitions, as a result of which the Association was invited to submit a draft form of certificate which the profession would be prepared to furnish on the basis of the 2s. 6d. fee. A simple form of certificate embodying the fundamental requirements of the department was drafted by the Medico-Political Committee, and forwarded to the Ministry of Munitions in October, 1917, but does not appear to have been adopted by that department. Notwithstanding the negotiations on this subject which have taken place between the Association and the Ministry of Munitions, practitioners in various parts of the country are still being asked by employment exchanges to fill in the original complicated form of report for a fee of 2s. 6d. It seems necessary, therefore, to remind practitioners that the Association considers a fee of 5s. should be the minimum payment for such reports.

War Emergency Fund of the Royal Medical Benevolent Fund.

The following further subscriptions have been received from Divisions of the Association, and have been passed on to the Treasurer of the War Emergency Fund. The names of individual subscribers are published monthly in the advertisement pages of the JOURNAL.

Association Notices.

GRANTS IN AID OF SCIENTIFIC RESEARCH.

THE Council of the British Medical Association is prepared to receive applications for grants in aid of scientific research into the causation, treatment, or prevention of disease. Preference will be given to medical practitioners

and to applicants who propose to investigate the problems directly related to practical medicine.

Applications for grants for the year 1918-19 must be received not later than June 15th, 1918, and must be made on the prescribed form, which, together with the regulations governing the suggested grants, can be obtained on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

Meetings of Branches and Divisions.

LANCASHIRE AND CHESHIRE BRANCH: ROCHDALE DIVISION.

At the annual meeting of the Rochdale Division on April 4th the annual report was presented; the financial statement showed a balance in hand of £2 14s. 9d.

The following officers were elected:

Chairman: Dr. Geddes (Heywood). *Vice-Chairman:* Dr. Lord (Castleton). *Secretary and Treasurer:* James Melvin (Rochdale). *Auditor:* Dr. Harris (Rochdale). *Representative to Annual Meeting and Branch Council:* Dr. Lord (Castleton). *Deputy Representative:* Dr. Carse (Rochdale). *Executive Committee:* The officers, together with Drs. Ashcroft (Littleborough), Shaw (Bacup), and Kilroe and Wilson (Rochdale).

INSURANCE.

LOCAL MEDICAL AND PANEL COMMITTEES.

Surrey.—At a meeting of the Panel Committee, on February 15th, a resolution was passed protesting against an expression of opinion by the Medical Benefit Subcommittee, and maintaining the right of a Panel Committee to address or attempt to influence its electorate on any subject and in any way it thought desirable. It was agreed to accept payment for the supply of urgent medicines and dressings under the Croydon scheme, in which articles supplied are priced and paid for at the current drug tariff rates. A proposal to join the Association of Panel Committees was defeated.

Sunderland.—At a meeting of the Local Medical and Panel Committee, on April 19th, Dr. Modlin presented a report upon the proceedings of the special conference on April 11th, 1918. After a discussion in which the Insurance Acts Committee and the British Medical Association were severely criticized, the following resolutions were adopted:

That the only body competent to advance panel practitioners' interests is one possessing the constitution of a trades union.

That the Sunderland practitioners who are members of the P.M.P.U. (thirty-three in all) ask that body to constitute them a branch of the union.

That the membership of the P.M.P.U. be maintained and steps be taken to advocate the claims of that organization to the support of panel practitioners and to extend its ranks.

Renfrew County.—At a meeting of the Panel Committee, on March 27th, it was decided (a) that in the present national circumstances the profession should not favour any proposal to refuse to renew insurance contracts; (b) that organization for the future should be proceeded with so far as reasonably possible; (c) that without prejudice to any future discussion as to the adequacy of the present remuneration the profession should, in the meantime, follow up the suggestion made by the Government as to an additional travelling grant and as to an additional grant in respect of increased cost of living for practitioners below the £500 income line. An explanatory memorandum issued by the Association of Panel Committees was allowed to lie on the table, the Committee unanimously expressing its confidence in the Insurance Acts Committee of the British Medical Association.

County of Forfar.—At the annual meeting, on February 13th, of medical practitioners resident in the Forfarshire area, the members of the County of Forfar Local Medical Committee were duly elected. At the inaugural meeting of the Local Medical Committee it was resolved to impose a levy for expenses of one penny per five insured persons on the panel of each practitioner in the area from each of the four quarterly payments to be paid during the year.

Matters Referred to Divisions.

ANNUAL REPRESENTATIVE MEETING IN LONDON,

Thursday, July 25th, and following day(s).

FURTHER NOTICES OF MOTION.

The following Notices of Motion by the Divisions and Branch stated have been received for consideration by the Annual Representative Meeting of the Association, to be held in London on Thursday, July 25th, 1918, and following day(s):

(A) AFFECTING BY-LAWS OF ASSOCIATION.

Election of Members of the Association.

- By Eastbourne:
That in By-law 5 (I) (Section II of By-laws, as to membership), the word "Division" be substituted for "Branch," *mutatis mutandis*, throughout its text, and elsewhere.

Arrears of Subscription: Cessation of Membership.

- By Fife:
That, for the duration of the war, the automatic removal from the register of members in accordance with By-law 13 should not be proceeded with, if at all possible.

(B) AFFECTING ADMINISTRATION OF ASSOCIATION.

Procedure of Inquiry into Complaints Regarding Professional Conduct.

- By Eastbourne:
That it be an instruction to the Central Ethical Committee to amend No. 7 of the Ethical Rules of Divisions so as to give every member the right to have his case investigated by the Ethical Committee of the Division, provided that no legal liability be incurred by the Association.

Question of a Medical Annual; Question of Accident Insurance in Connexion with the "British Medical Journal."

- By Ashton-under-Lyne:
That it would be to the advantage and interest of the British Medical Association to publish a medical annual, and to formulate a system of accident insurance in connexion with the BRITISH MEDICAL JOURNAL.

(C) AFFECTING POLICY OF ASSOCIATION.

Representation of Medical Profession in Parliament.

- By Ashton-under-Lyne:
That the Association take steps to improve the medico-political education of the profession with a view to securing the medical vote for medical candidates for university seats in Parliament.
- By Bournemouth:
That the time has arrived when the medical profession should be more fully represented in the House of Commons. To this end financial aid should be provided when necessary for candidates approved by the British Medical Association, from funds specially collected by it for this purpose.

Organization of Medical Students.

- By Ashton-under-Lyne:
That the Association take steps to organize the medical schools (students) into probationary Divisions; the membership fee for students to be 10s. 6d., with right to the JOURNAL.

By order,
ALFRED COX,
Medical Secretary.

May 21st, 1918.

British Medical Association.

CURRENT NOTES.

Handbook of the Association.

In accordance with the instruction of the Annual Representative Meeting, 1917, the Council has prepared a Handbook of the Association for 1918. Copies are being sent to all honorary secretaries of Divisions and Branches, representatives of constituencies, and deans of medical schools. The volume contains the more important decisions of the Representative Body as to questions of policy, information as to membership of the Association, subscription, ethical machinery, constitution, information bureau, procedure, library, science grants, scholarships and prizes, the Medical Insurance Agency, and a list of the Council and Central Committees. It is believed that the Handbook will be of great service to the workers for the Association, and suggestions for embodiment in future editions will be welcomed. A limited number of copies are on sale (2s. 6d. a copy; post free, 2s. 8d.). Members may obtain copies, on application accompanied by remittance, addressed to the Acting Secretary, 429, Strand, W.C.2.

Doctors' Chauffeurs and Military Service.

The attention of the Central Medical War Committee has been drawn to the difficulties caused to rural practitioners by the calling up of their chauffeurs under the latest Military Service Act. In remote districts where the population is scattered and the roads difficult and where opportunities of securing repairs are few, the services of chauffeurs able to execute running repairs are essential if the work of the doctors is to be carried on. Urgent representations were made to the Ministry of National Service, which has replied that a delay in calling up for service will be exercised in favour of such chauffeurs where efforts to secure substitutes have failed; that an instruction to this effect had been sent to the local Commissioners; and that the delay would be for about a month in order to enable further endeavours to obtain substitutes to be made. The Labour Department of the Ministry will do what it can to help in providing substitutes; doctors requiring them should communicate with the employment exchanges at the command discharge centres; the local Commissioners will be glad to give further information.

Association Notices.

ELECTION OF COUNCIL, SESSION 1918-19.

NOTICE is hereby given that the following have been duly elected members of the Council for the 1918-19 Session:

BRANCHES IN THE UNITED KINGDOM.

England.
North of England, North Lancashire, and South Westmorland Branches: Professor R. A. Bolam, M.D., Newcastle-on-Tyne.
Yorkshire Branch: H. J. Campbell, M.D., F.R.C.P., Bradford.
Lancashire and Cheshire Branch: Sir James Barr, M.D., F.R.C.P., Liverpool. Wm. Fletcher Shaw, M.D., Manchester.
East York and North Lincoln and Midland Branches: Adam Fulton, M.B., Nottingham.
Cambridge and Huntingdon, East Anglian, and South Midland Branches: No return.

Birmingham and Staffordshire Branches: E. Noël Nason, M.D., Nuneaton.

North Wales, Shropshire and Mid Wales, and South Wales and Monmouthshire Branches: W. B. Crawford Treasure, M.D., Cardiff.

Bath and Bristol, Gloucestershire, West Somerset, and Worcestershire and Herefordshire Branches: George Parker, M.D., Bristol.

Dorset and West Hants, South-Western, and Wiltshire Branches: Russell Coombe, F.R.C.S., Exeter.

Oxford and Reading and Southern Branches: D. A. Sheahan, M.D., Portsmouth.

Kent, Surrey, and Sussex Branches: Claude Wilson, M.D., Tunbridge Wells.

Scotland.

Aberdeen, Northern Counties, Dundee and Perth Branches: C. S. Young, M.R.C.S., L.R.F.P.S.Glas., Dundee.

Glasgow and West of Scotland (Five County Divisions), Border Counties and Stirling Branches: John Goff, M.D., Bothwell.

Ireland.

Connaught and South-Eastern of Ireland Branches: Denis Walshe, M.D., Graigue, co. Kilkenny.

Leinster Branch: Wm. Doolin, M.D., Dublin.

Munster Branch: Joseph Ginsani, M.D., Cork.

Ulster Branch: R. J. Johnstone, F.R.C.S., Belfast.

By Order of the Council.

W. E. WARNE,
Acting Secretary.

May 25th, 1918.

INSURANCE.

TERM OF OFFICE OF PANEL COMMITTEES.

THE English National Insurance Commissioners last year extended the term of office of Panel Committees to July 15th, 1918. In view of the difficulty of holding elections at the present time the Commissioners anticipate that a similar extension of the term of office for a further year will meet the wishes of insurance practitioners generally, and they accordingly propose to adopt this course; but before doing so they are prepared, as on the last occasion, to consider any expressions of opinion from Panel Committees, or their constituents, in favour of holding an election. If the Commissioners are satisfied, either by a resolution passed by a meeting of a Panel Committee, or by representations from a substantial number of individual practitioners in an area, that an election is generally desired, they propose to refrain from exercising their power to extend the term of office of the present members of the Committee, which will accordingly end on July 14th next. Resolutions or representations must be notified to the Commissioners not later than June 15th.

Dr. B. A. Richmond, secretary to the London Panel Committee, in a letter dated May 17th, draws the attention of panel practitioners in London to this matter, and points out that the Panel Committee has expressed its opinion that no election should be held. In the absence of an expression of opinion on the part of panel practitioners contrary to this view, the Commissioners will extend the term of office of the present Committee for a further period.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are announced by the Admiralty: Fleet Surgeon R. S. Osborne to the *Bacchante*; Temporary Surgeons A. P. Robb, H. Whyte, and L. D. Porteous to Haslar Hospital; I. H. Captain (acting Major) H. Seddon to be acting Lieut.-Colonel whilst commanding a field ambulance.

Captain (acting Lieut.-Colonel) R. S. Taylor, D.S.O., reverts to the temporary rank of Major on ceasing to command a field ambulance, with precedence from May 29th, 1915.

Captain (Brevet Major) C. N. Draycott relinquishes his commission on account of ill health, and retains the brevet rank of Major (substituted for notification in the *London Gazette* of April 3rd, 1918).

Captains to be acting Majors whilst specially employed: A. O. Watkin, K. D. Wilkinson, W. T. P. Meade-King, J. H. P. Fraser, M.C., T. W. Hancock, J. H. Thomas, D.S.O., B. E. Potter.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 6s., which sum should be forwarded with the notice not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

BIRTH.

ROBINSON.—On May 15th, 1918, at 392, Upper Richmond Road, Putney, S.W.15, to William E. and Catherine Robinson, a daughter.

DEATH.

WILKINSON, Arthur W., Captain West Yorkshire Regiment, died in France from wounds received in action on April 18th, aged 34 years. He was the second surviving son of Dr. Wilkinson of Tynemouth.

GENERAL COUNCIL

OF

MEDICAL EDUCATION AND REGISTRATION.

SUMMER SESSION, 1918.

THE summer session of the General Council of Medical Education and Registration was opened at the Council's offices, Hallam Street, London, on May 28th. Mr. TOMES, the Senior Treasurer, presided over the preliminary proceedings.

ELECTION OF PRESIDENT.

Sir Donald MacAlister was unanimously re-elected President for a further period of five years, on the motion of Dr. NORMAN MOORE, seconded by Sir JOHN MOORE. In welcoming Sir Donald MacAlister to the chair, Mr. TOMES referred in high terms to the work which the President had done on behalf of the Council, both during the half-yearly sessions and during the interims. Sir DONALD MACALISTER thereupon took the chair.

PRESIDENT'S ADDRESS.

Gentlemen,—Yesterday I completed my third term of office as President. My colleagues of the Executive Committee thought it would not be unfitting on my part, and might be agreeable to the Council, were I to prepare a short communication on the matters which have occupied us during the recess. It would at least serve to carry on the sequence of addresses from the chair, which you have been good enough to accept at my hands since you first placed me there in 1904. By your kindness to-day, I am now in a position to offer my proposed "communication" as a presidential address. I am deeply conscious of the honour your continued trust confers upon me. My tenure has already extended beyond that of any of my predecessors in the chair. I am equally conscious of the responsibilities the office entails. With what strength I have, I shall strive to become more worthy to share them with you. Your loyal and generous support lightens the burdens of the President, and makes him your very grateful debtor.

My membership of the Council dates from 1889. Sir George Hare Philipson joined it in 1892. When he passed away, on January 24th, 1918, he had for over a quarter of a century represented among us his well-beloved University of Durham. His courtly manners and his genuine friendliness gave him a warm place in our regard. His great services, professional and academic, to the cause of medical science in the North, gave weight to his judicious counsels here. We shall miss his kindly presence and co-operation. His contemporary at Caius College, Cambridge, Sir T. Clifford Allbutt, has just retired, after ten years' service as our member from that university. Happily in his case we can still count on a continuance, even in so-called retirement, of his luminous contributions to knowledge and wisdom. The writings of the Regius Professor of Physic at Cambridge have always the charm of style—the style which reveals the man. The Council takes leave of him reluctantly and with the best of good wishes.

To fill the places thus vacated, Durham sends us Professor Robert Howden, the accomplished editor of *Gray's Anatomy*; and Cambridge, Dr. Frederick Gowland

Hopkins, F.R.S., Professor of Biochemistry. Their scientific eminence will add to the repute and to the widely representative character of the Council.

Sir Frederick Taylor, our Junior Treasurer, whose health has given some cause for anxiety, is, we are glad to know, regaining strength, though he will probably be unable to attend during the present session. When he retired, in March, from the presidency of the Royal College of Physicians of London, that ancient and distinguished body called to its highest office our learned colleague, Dr. Norman Moore, chairman of the Business Committee. It will be your wish to offer him all fraternal congratulations on the well-merited honour, and to express the hope that he may find its claims on time and strength to be compatible with his continued services on our behalf.

The collection of the portraits of those who during the last sixty years have shared our labours, has been increased by the bequest of Sir George Philipson's, left to us by his will; and by the gift of Mr. Brudenell Carter's, for which I had the pleasure of thanking him in your name.

Finance.

The effects of the long-protracted war can be traced in most departments of the Council's activity.

With regard to finance, our expenditure increases, and our income is diminished. At the close of 1917 the accounts showed that the surplus of revenue for the General and Branch Councils had fallen to £363 11s. 10d. For 1916 the surplus was £1,014 14s. 1d. In the current year, if matters do not improve rapidly, the prospect of a favourable balance is small. Strict economy, both of time and of expense, becomes an imperative duty to the nation and to ourselves. We have lent all our available funds for the public use, and whatever we can further save is urgently needed by the national treasury. Such economy means additional labour and inconvenience to members and staff, but these will be cheerfully borne in view of the objects to be gained.

Number of Registered Practitioners.

With regard to the *Medical Register* for 1918, there is a net increase of 338 in the number of registered practitioners, as compared with a net increase of 256 in that for 1917. The number removed on intimation of death is 801, as compared with 933 in the *Register* for 1917. It is certain, however, that the losses of the year are not yet fully known. The periodical revisions which reveal these to the Registrar, by the operation of Section 14 of the Medical Act, 1858, have of necessity had to be suspended during the war. When peace returns it will be our first duty to resume them. The new names registered in 1917 numbered 1,134; while those in 1916 numbered 1,202. The corresponding figure for 1914 was 1,433.

The *Dentists Register* shows a net increase of only 12, and thus reflects the undue depletion of the men in training for this important branch of the national service which occurred in the first years of the war. Measures have now been taken to check the drain, but it will be some time before their effects are apparent.

Number of Medical Students.

The medical students in actual attendance on professional instruction were, as I reported in November last,

more numerous in October, 1917, than at the beginning of the year. The *Students Register* for 1917 shows that the number registered by each of the three Branch Councils was higher than in the preceding year. The total registrations for 1917 amounted to about 2,165, as against 1,480 in 1913, and 1,600 in 1914. The registrations for 1917 have, indeed, exceeded those for any year since 1891. A recent instruction has, moreover, with a view to the speedy training of men fit to serve as surgeon-probationers in the navy, directed the conditional and temporary release from combatant duty of students who have completed their preliminary scientific examinations in physics, chemistry, and biology, and are thus ready for the second stage of the curriculum. They will be expected to finish this stage within a prescribed time, to keep up their military training, and to accept service with the navy when required. As this measure of release has probably taken effect by this time, I have suggested to the Minister of National Service that useful information would be gained regarding the prospect of replenishing the ranks of the profession hereafter, were a census to be taken now on the lines of those instituted on behalf of the Council in 1917. From the figures so obtained we might ascertain in what degree the forecasts of a serious shortage of qualified practitioners in 1918 and 1919 are likely to be verified. The Ministry has adopted the suggestion, and the census is now in progress.

Entrance Examinations.

The influx of exceptionally young students, considerably below the age of 18, into the ranks of the First Year, has led some deans and registrars to suggest to me that a proportion of them are being prematurely withdrawn from their ordinary school studies, to the detriment of their general education. It is further suggested that the Junior or minimum Preliminary Examination is no longer a sufficient guarantee of maturity for professional study in the case of such young students; and that the present situation would fully justify the Council in taking the step it has long contemplated, and withdrawing its recognition from all examinations in England and Scotland lower in standard than the new School Examination organized by the English Board of Education, and the Scottish Arts or Science Preliminary and Leaving Certificate Examination. As these exempt the holders from university matriculation tests, the vexed question of "compulsory Latin" would incidentally be solved so far as we are concerned. The Council has ceased to require Latin of students who are thus guaranteed to have received a sound secondary education in a sufficient range of other subjects, and to have qualified for matriculation in arts or science. The experience of the next year or two will show whether those are right who question the fitness of many very young students, now admitted to the first year stage, to profit by a professional course. But in the meantime the question of raising now and permanently the minimum educational standard for entrance thereon may profitably be considered by the Education Committee. There is undoubtedly, for the time being, a "shortage of doctors"; but there is apparently no shortage of potential medical students. If by a step, in itself educationally sound and desirable, it were practicable to ensure that only the better prepared of these were selected as actual recruits for the profession, the advantage would be obvious.

The New Military Service Act.

The demands made by the war on the body of qualified medical practitioners are still increasing. The transfer of the duties of selection and distribution to the Ministry of National Service, which I described in my last address, has led to better organization and to fuller co-operation between the authorities and the civil professional committees. But these improvements in machinery alone have now proved inadequate to meet the greater need for man power in the field and at home. Accordingly, the new Military Service Act has extended the service age limit for the whole male population of Great Britain to 50, and for medical men to 55. This special legislation for our profession is perhaps a tribute to its general standard of healthy vigour; it is certainly an admission that the remaining supply of practitioners under 50 is too scanty to provide for all the fresh national requirements which the situation has induced. This latter conclusion has been urged on the Government for over a year past by professional bodies. The particular mode of meeting

the situation now adopted by Parliament may not be that which all would favour. But we shall do well to accept it as an honour that, as we are held capable of a unique form of service to the State, so we are charged with a heavier responsibility than others. Under the new arrangements some readjustment of the functions of professional tribunals and committees will doubtless be required, both in England and in Scotland. Exemption from military service on "occupational" grounds—that is, on the simple ground that a man is a qualified practitioner—will almost necessarily be "conditional" on his undertaking, if required, to give professional service where there is urgent need of medical help. In other words, a certain amount of "redistribution" and "concentration" of civil practice will have to be arranged, in order that places that have yielded up all their younger doctors to the army may not be left without medical provision. It is satisfactory to learn that in making such arrangements the Minister will continue to avail himself of the experience and local knowledge of the professional Committees, which have so greatly assisted him under the earlier Military Service Act.

The Midwives (Ireland) Bill.

The Midwives (Ireland) Bill, to which I referred six months ago, has passed into law; and the whole of the United Kingdom is now, as regards midwifery, under statutory conditions which are uniform in substance, though differing in administrative detail. The Irish Midwives Board is already in process of formation. Its first duty will be to frame rules regulating the admission and practice of midwives, and these will be submitted for consideration to the Executive Committee of this Council before they become operative. Experience has shown that the English Midwives Act, which was the first to pass, requires certain amendments to make its working more effective, and to articulate it with the Scottish and Irish Acts. It is therefore likely that an English Midwives Act Amendment Bill may be submitted to Parliament at an early date.

Departmental Committee on the Dentists Act.

The Departmental Committee on the Dentists Act, appointed by the Lord President, is still taking evidence under its terms of reference. As your President I appeared before it for the second time, and supplied information regarding the steps taken by the Council towards a revised curriculum for qualifications in dental surgery. The war has in various ways brought home to the nation the inadequacy of the present law to provide a body of dentists sufficient in number and in skill for the requirements of public health and efficiency. It is much to be desired that the Committee now sitting may devise means for remedying the evil by amending the law. We may hope before next session to have its report in our hands.

Pharmacopoeial Economies.

War conditions, which last year made it necessary to limit the use of glycerin and refined sugar in pharmacy, have this year forced us to a like economy of fats and oils. Lard and suet must be reserved for food; castor oil and olive oil are scarce, and are required for other important uses. Representations from the Government satisfied the Executive Committee that immediate action must be taken to authorize the use of substances other than these in the official ointments, liniments, etc., of the *British Pharmacopoeia* 1914. After consultation with the Pharmacopoeia Committee, it was decided that the only way to meet the emergency was to follow the precedent of July, 1917, and to amend and alter the *Pharmacopoeia* by the insertion therein of an official leaflet, of which notice was published on behalf of the Council, as the Act directs, in the *Gazettes* of London, Edinburgh, and Dublin on March 29th, 1918. Pharmacists and dispensers thus obtained liberty, in making certain official preparations, to substitute suitable bases for the fatty substances that are no longer procurable. The prompt response of the Executive Committee to the representations made to it has been acknowledged by the Government authorities concerned.

Medical Certificates.

The remarks made, with your assent, in my last address, concerning the danger of laxity in the granting of medical certificates, have met with general acceptance, and have, with your Warning Notice, been included by the Ministry

of National Service in a circular of suggestions issued to practitioners throughout the country. It is satisfactory to report that intimations of alleged laxity have almost ceased to reach us; and no formal complaint of culpable conduct in respect of "untrue, misleading, or improper" certificates has been submitted for inquiry by the Council.

Offences under Medical Service Acts.

Some of your time must, however, be devoted to certain cases in which practitioners have been convicted in the criminal courts of other offences connected with the operation of the Medical Service Acts. These differ from cases in which the charge is one of "infamous conduct in any professional respect." The Council, on proof of the conviction, has to determine whether, having regard to the nature of the offence, it shall "see fit" to direct the erasure of the convicted practitioner's name from the Register.

Prosecution of Impostors.

Considerable activity has been shown by the police and other civil authorities in prosecuting impostors who deceive the public by illegally assuming medical titles and functions. As I have already indicated, the existing emergency has in some places been boldly exploited by such persons, to the obvious detriment of the community. In a number of instances, where the prosecution has been supported by the Medical Defence Union, convictions have been obtained and penalties inflicted.

Direct Representatives.

Unless conditions alter, the general election of Direct Representatives to the Council, which has been postponed by Order until November, 1918, will have to be further postponed. The question is engaging the attention of the Lord President, who is fully informed of the difficulties of the existing situation.

Duration of Session.

Members may find that the difficulties extend to our domestic arrangements; but they will accept the assurance that the Council's officers have done their best to minimize the inconvenience, and take comfort in the prospect that the session will not be of long duration.

British Medical Association.

CURRENT NOTES.

Supply of Surgical Instruments to Civilian Medical Practitioners for their Private Use.

IN consequence of war conditions the Ministry of Munitions has found it necessary to control the supply of surgical instruments. Army and navy surgeons are supplied with any necessary instruments in the ordinary course, while civil hospitals have been furnished by the Ministry of Munitions with a maintenance upkeep permit and can obtain surgical instruments by quoting the number of the permit to their suppliers. The Priority Department of the Ministry of Munitions has now asked the British Medical Association to undertake the investigation of all applications from civilian medical practitioners for surgical instruments for their private use, and has authorized the Association to stamp such applications as the Association may approve with the necessary permit number and classification to enable the practitioner to obtain the required instruments from the manufacturers. Civilian medical practitioners requiring any surgical instruments are requested to furnish full particulars to the Medical Secretary, 429, Strand, W.C.2, but it must be understood that as supplies of surgical instruments are limited, requirements must be kept down to the absolutely necessary, and care will have to be exercised by the Association in endorsing applications. All applications must be accompanied by a Ministry of Munitions Form of Certificate (to be obtained from any post office), filled in and signed by the medical practitioner placing the order.

War Emergency Fund of the Royal Medical Benevolent Fund.

The following further subscriptions have been received from Divisions of the Association in response to the recent appeal, and have been passed on to the Treasurer of the War Emergency Fund. The names of individual sub-

scribers are published monthly in the advertisement pages of the JOURNAL.

Association Notices.

MEETING OF COUNCIL.

The next Meeting of Council will be held on Wednesday, June 26th, in the Council Room, 429, Strand, London, W.C.2.—By order,

W. E. WARNE,
Acting Secretary.

May 30th, 1918.

ELECTION OF COUNCIL, SESSION 1918-19.

NOTICE is hereby given that the following have been duly elected members of the Council for the 1918-19 Session:

Cambridge and Huntingdon, East Anglian, and South Midland Branches: E. O. Turner, M.B., Great Missenden, Bucks.

Metropolitan Counties Branch: M. G. Biggs, M.D., 101, Northcote Road, Battersea, S.W. 11. B. Brackenbury, M.B.C.S., L.R.C.P., 21, Quernmore Road, Stroud Green, N. Sir Bertrand Dawson, G.C.V.O., C.B., 32, Wimpole Street, W. W. McAdam Eccles, M.S., F.R.C.S., 124, Harley Street, W.

By Order of the Council,

W. E. WARNE,
Acting Secretary.

June 1st, 1918.

HOME CONSTITUENCIES FOR ELECTION OF REPRESENTATIVE BODY, 1918-19: RETURNS OF REPRESENTATIVES.

NOTICE is hereby given that pursuant to authority delegated by the Council in that behalf, the Organization Committee, on consideration of the membership figures contained in the Annual List of Members, 1918, has decided that the Home Constituencies for election of the Representative Body, 1918-19, under By-law 33, shall be the same as for 1917-18, with the exception that the newly approved Dewsbury Division be grouped with the Leeds Division to form one constituency.

Honorary Secretaries who have not yet forwarded to the Head Office the names and addresses, and dates of election, of the Representatives appointed by their constituencies for 1918-19, are requested to forward these particulars to the Medical Secretary by the earliest possible date. Under By-law 35, Representatives require to be elected not more than nine months nor less than four weeks before the Annual Representative Meeting, and their names to be notified to the Head Office by at latest July 4th. The Representative can, if necessary, be elected and instructed by one and the same meeting of the constituency.

By order,
ALFRED COX,
Medical Secretary.

May 25th, 1918.

BRANCH AND DIVISION MEETINGS TO BE HELD.

EDINBURGH BRANCH: SOUTH-EASTERN COUNTIES DIVISION.—Dr. M. J. Oliver, Honorary Secretary (St. Boswells) gives notice that the annual meeting of the Division will be held at the Railway Hotel, Newtown St. Boswells, on Wednesday, June 19th, at 3.15 p.m., for: (1) Election of officers; (2) annual report and financial statement; (3) report of War Committee and reappointment of Committee; (4) instructions to Representative at Representative Meeting.

METROPOLITAN COUNTIES BRANCH.—Mr. N. Bishop Harman and Captain Wilfred Kingdon, R.A.M.C. (Honorary Secretaries), give notice that the annual general meeting of the Branch will be held at 429, Strand, W.C.2, on Friday, June 28th, at 4 p.m. The business will be: (1) Report of scrutineers as to the election of new officers. (2) The annual reports of Council and of representatives of the Branch on the Central Council. (3) President's address, Dr. M. G. Biggs (Professional organization from the point of view of the general practitioner).

SOUTH WALES AND MONMOUTHSHIRE BRANCH.—Dr. L. Freeman Marks, Honorary Secretary (Brynhaelog, Mumbles, Glam.), gives notice that the annual meeting of the Branch will be held at the General Hospital, Swansea, on Thursday, June 13th, at 3.30 p.m.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty: Fleet Surgeon A. Woolcombe to the *Colossus*. Acting Fleet Surgeon E. J. Steegman to the *President*, additional, for service at the Medical Depot. Staff Surgeon F. S. Wilkinson to the *Chatham*. Surgeon C. E. Gresson to Yarmouth Hospital. Temporary Surgeons J. F. W. Campbell to the *Lord Nelson*; J. L. Pringle to the *Crescent*; G. Cochrane to the *Europa*; C. Colmer to the *Maggie*; A. S. Mackie to the *Imperieuse*; A. K. Roche to the *Hearty*; G. Young and C. K. Scales to Chatham Hospital; H. J. R. Surrage and T. H. R. McKiernan to the *Lancaster*.

ROYAL NAVAL VOLUNTEER RESERVE.

Staff Surgeon H. L. Murray to the *Engle*.

ARMY MEDICAL SERVICE.

Colonel S. G. Moores, C.B., C.M.G., to be temporary Major-General whilst employed as Director of Medical Services of an army.

ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel R. H. Hall is placed on retired pay. Temporary Majors to be temporary Lieut.-Colonels: Sir R. Armstrong-Jones, H. C. Marr, J. J. G. Blandford.

To be acting Lieut.-Colonels whilst in command of a medical unit: Majors G. E. Ferguson and S. B. Smith, D.S.O.; Captains C. H. Stringer, G. G. Collet, and L. T. Poole, M.C.; Lieutenant (temporary Captain) R. W. Galloway.

Temporary honorary Major T. E. K. Stansfield, M.B., to be temporary honorary Lieut.-Colonel.

Temporary honorary Major W. J. Richard to be temporary honorary Lieut.-Colonel whilst employed at the Merryflats War Hospital.

To be acting Lieut.-Colonels whilst specially employed: Major T. J. Potter; Temporary Majors J. L. Birley, (Captains R.A.M.C.T.F.) L. C. Bruce, M.C., and C. S. Young; Temporary Captain (temporary Major) F. G. W. Deane; Temporary Captain P. Steele.

To be acting Majors: Captain C. T. Edmunds (from January 4th to 29th), Temporary Captains D. B. Pascali, N. A. A. Hughes, A. C. Hancock, M.C., H. J. de Brent, M.C., R. Tindall, M.C.; Temporary Lieutenant D. C. Ogilvie.

Temporary Captain W. Kennedy-Taylor to be acting Major, February 27th, 1918 (substituted for notification in the *London Gazette* of April 13th, 1918).

Temporary Captain P. J. A. Seccombe to be temporary Major whilst commanding troops on a hospital ship.

Temporary Captains John Purcell and William Core, M.B., and temporary Lieutenant George Liggett, M.B., are dismissed the service by sentences of general court-martial, the first two dated March 14th, and the third February 19th.

Lieutenants (temporary Captains) to be Captains: K. A. M. Tomory, J. S. Sloper, C. Wilson, H. N. Stafford, M.C., R. J. Sullivan, M.C., R. A. Anderson, F. M. Lipscomb, H. P. Rindolf, D. N. Macleod.

J. Beckett to be temporary honorary Captain whilst serving with St. John Ambulance Brigade Hospital.

The undermentioned late temporary Lieutenants are granted the honorary rank of Lieutenant: P. Hall, O. A. Purnell.

Temporary Lieutenants to be temporary Captains: T. N. Darling, J. E. Mitchell, R. Beeley, H. G. Sparrow, C. E. Evans, C. S. Stollerforth, T. Forde, G. V. Fiddian, P. M. Reid, R. H. S. Torney, A. G. Wilson, M. Horan, W. St. J. Cogan, J. C. D. Allan, S. McMurray, J. A. Wood, H. A. Cecil, A. Briggs, P. S. Clarke.

Major F. D. G. Howell, D.S.O., M.C., to be temporary Lieutenant-Colonel whilst employed as Assistant Director of Medical Services of an army.

Major T. C. Lucas is placed on the half-pay list on account of ill health contracted on active service.

To be acting Majors whilst specially employed: Captain J. W. Houston, D.S.O., F. J. Thorne, O. Shields, W. F. Abbott, W. Fell, H. K. G. Hodgson; Temporary Captains B. Hogan, A. K. H. Pollock, J. Taylor, A. J. H. Boyton, K. Edwards, H. F. Sheldon, G. Marshall, J. O'D. Egan, W. F. Law, D. J. Glen, J. P. Duncan, W. M. Buchanan, D. Fletcher, P. H. Macdonald, J. T. McCullagh, W. E. P. Phillips, J. Philp, J. Porter, A. Abrahams, J. T. McCullagh, W. E. P. Phillips, A. C. E. Gray, A. H. M. Robertson, R. M. Fenn, D. F. O'Kelly, J. E. Power, Lieutenant (temporary Captain) O. B. Pratt, Lieutenant D. Burrows.

N. W. Rawlings, H. C. C. Rennie, G. Morria, and G. N. B. Sebastian, late temporary Captains, are granted the honorary rank of Captain.

Officers relinquish their commissions: Temporary Major T. B. Rhodes on ceasing to be employed with the North Staffordshire Infirmary. Temporary Captains T. G. Copestake and H. K. Graham-Hodgson (on account of ill health contracted on active service, and are granted the honorary rank of Captain), (acting Major) C. A. L. Evans, E. P. Blasbki, P. S. Hopkins, T. B. Brandon, C. W. Walker, H. C. Davies, E. W. Lynch, R. Buchanan; F. S. Campbell (on taking up duty under the Ministry of National Service), S. F. Lusk, E. A. Morgan, G. F. Nelson, R. P. Williams, F. J. Colling, G. Stewart, A. A. Hill, F. W. S. Stone, A. Cameron (and is granted the honorary rank of Captain), (acting Major) G. W. Parry, C. D. G. Odenough, W. T. Evans, W. L. Christie, C. A. Verge (August 12th, 1917, substituted for notification in the *London Gazette* of September 5th, 1917), M. McK. McKrae, M.C., S. J. A. Beale, M.C., J. S. E. Selby, W. Carnes, W. C. Blackham, J. V. Watson, E. H. Montgomery, A. E. J. Barcroft, temporary honorary Captain W. R. Carter (on ceasing to be employed with the British Red Cross Society in France); temporary Lieutenants C. L. Traylor and C. Beards (on account of ill health and are granted the honorary rank of Lieutenant), B. K. Nutman, H. S. Johnston, W. N. Eustace, J. K. Thompson, K. B. Allan (April 30th, 1917, substituted for notification in the *London Gazette* of October 9th, 1917), A. A. Bisset, A. H. G. McKintosh, C. F. Beavor (on account of ill health contracted on active service and is granted the honorary rank of Lieutenant), W. Robertson, F. R. Sinton, H. B. Corry, G. B. Scott, A. J. M. Paget, R. Butterworth, F. J. Willans; temporary honorary Lieutenants G. Lucas (on ceasing to serve with a stationary hospital), O. C. Snyder, J. W. Hawthorne.

Temporary honorary Lieutenants to be temporary honorary Captains: E. D. Busby, E. S. Welles, E. S. Fish, F. Packard, C. N. Lewis, W. S. Ramsey, L. M. Van Stone.

J. P. Griffin to be temporary honorary Lieutenant whilst serving with British Red Cross Hospital, Netley.

ROYAL AIR FORCE.

MEDICAL BRANCH.

A. A. Bisset and G. H. Warner to be temporary Captain and temporary Lieutenant respectively.

H. C. T. Langdon and F. F. Muecke (temporary Majors R.A.M.C.) are granted temporary commissions as Majors and to be temporary Lieutenant-Colonels whilst employed as Lieutenant-Colonels (medical).

A. H. Cheate is granted a temporary commission as Major and to be temporary honorary Lieutenant-Colonel whilst holding present appointment as temporary honorary Lieutenant-Colonel (medical).

R. P. Williams (temporary Captain R.A.M.C.) is granted a temporary commission as Captain and to be temporary Lieutenant-Colonel whilst employed as Lieutenant-Colonel (medical).

H. Prithard (temporary honorary Major R.A.M.C.) is granted a temporary commission as honorary Major.

M. W. Flack (temporary honorary Major R.A.M.C.) is granted a temporary commission as honorary Major and to be temporary honorary Lieutenant-Colonel whilst employed as temporary honorary Lieutenant-Colonel (medical).

A. P. Bowden and J. McIntyre (temporary Captains R.A.M.O.) are granted commissions as Captains and to be temporary Majors whilst employed as Majors (medical).

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Major A. C. Turner, from D.A.D.M.S., to be Major.

Captains (acting Majors) relinquish their acting rank on ceasing to be specially employed: H. P. Malcolm, R. G. Badenock.

Captain G. H. Spencer to be acting Lieut.-Colonel whilst commanding a military hospital.

Captain W. W. Horton relinquishes his commission on account of ill health and is granted the honorary rank of Captain, November 30th, 1917 (substituted for the announcement which appeared in the *London Gazette* of November 29th, 1917).

Captain R. S. Taylor, D.S.O., to be acting Major with the pay and allowances of his substantive rank.

Captains C. H. Keay and J. L. Wilson relinquish their commissions on account of ill health and are granted the honorary rank of Captain.

Major E. G. Peck, D.S.O., to be acting Lieut.-Colonel whilst commanding a stationary hospital.

Captains to be acting Majors whilst specially employed: C. D. S. Agassiz, M.C., S. R. Gibbs, J. S. Ward, A. E. Huxtable, F. E. W. Rogers, A. J. Blackland, C. A. Pearson, J. Graham, C. J. Fox, C. T. Holland, W. R. Wood, J. E. G. Thomson, H. A. Macmillan, M.C., F. Metcalfe, H. D. Clement-Smith, J. A. Young, M.C., C. H. Caldicott, W. Brander, A. Griffith, W. F. Young, W. B. Hill, G. Young, (Brevet Major) R. C. Elmslie, S. G. Webb, A. G. Kewley, G. H. Cowen, W. L. Griffiths, A. R. Paterson, A. Ricketts, C.M.G., T. H. Richmond, A. Campbell, J. H. Craze, W. R. Bristow.

Lieut.-Colonel (Brevet Colonel) A. B. Gemmel, Major E. N. Cunliffe, and Captain A. Ellison, J. R. Riddell, and T. H. W. Alexander are restored to the establishment.

Captains W. B. Ainger and A. Richardson are seconded for services overseas.

Captain (acting Lieut.-Colonel) R. Waterhouse reverts to the temporary rank of Major on alteration in posting due to reorganization, with precedence from August 8th, 1915, March 15th, 1917 (substituted for notification in the *London Gazette*, May 22nd, 1917).

VOLUNTEER FORCE.

County of Aberdeen Volunteer Regiment, 11st Battalion.—The notice which appeared in the *London Gazette* of December 14th, 1917, regarding Medical Officer and temporary Captain R. M. Wilson is cancelled.

Durham Volunteer Regiment, 4th Battalion.—S. G. Moatyn to be Medical Officer and temporary Lieutenant.

Isle of Wight Volunteer Regiment, 1st Battalion.—Captain E. F. W. Bockell (late R.A.M.C.) to be Medical Officer and temporary Captain.

Hamshire Volunteer Regiment, 3rd Battalion.—Lieutenant R. J. Lytle (late R.A.M.C.) to be Medical Officer and temporary Lieutenant.

APPOINTMENTS.

PLAYFAIR, Ernest, M.B. Lond., M.R.C.P., Assistant Anaesthetist and Instructor in Anaesthetics, King's College Hospital.

WESTMAN, G., M.R.C.S., L.R.C.P., to the charge of the Great Northern Central Hospital's new Electro-Therapeutic and Massage Department.

WILSHAW, T. R., L.S.A., District Medical Officer of the Darlington Union.

DIARY FOR THE WEEK.

WEDNESDAY.

MEDICO-LEGAL SOCIETY OF LONDON, 11, Chandos Street, Cavendish Square, W.1.—5.30 p.m., Annual General Meeting.

FRIDAY.

WEST LONDON MEDICO-CHIRURGICAL SOCIETY, West London Hospital, 8.30 p.m.—Address, illustrated by lantern slides, by Captain D. McCrae Aitken: The Correction of Gross Bony Deformities Resulting from War Injuries.

ROYAL SOCIETY OF MEDICINE.—Section of *Larungology*: Friday, 3.45 p.m., Cases and Specimens. 4.30 p.m., Discussion: On Warfare Injuries and Neuroses of the Larynx, to be opened by Mr. Douglas Harmer and Dr. Henry Smurthwaite.

DIARY OF THE ASSOCIATION.

Date.	Meetings to be Held.
JUNE.	
5 Wed.	London: Medico-Political Committee, 2 p.m.
7 Fri.	London: Central Ethical Committee, 2.30 p.m.
12 Wed.	Kent Branch, Annual Meeting, Tonbridge, 3.30 p.m.

GENERAL COUNCIL

OF MEDICAL EDUCATION AND REGISTRATION.

SUMMER SESSION, 1918.

Sir DONALD MACALISTER, K.C.B., President,
in the Chair.

The Teaching of Preventive Medicine.

Dr. McVAIL proposed:

That it be remitted to the Education Committee (1) to report to the November Session of the Council as to whether the Council should take any action towards promoting or systematizing the teaching of preventive medicine in the medical schools throughout the country; and (2) to make such inquiry as the Committee may find necessary to enable it to report.

Dr. McVail said that the motion was not intended to relate to the existing teaching of public health, which had to do mainly with environment; what he was specially thinking of was the maintenance of the health of the individual, and he was of opinion that the general practitioners of the future should be so educated that they should always have in their minds the preventive aspects of medical work. At present perhaps the best work for the maintenance of health was being done through child welfare agencies and school medical inspection, because the cure of disease in early years often meant the maintenance of health throughout the rest of life. While treatment must remain for generations the most evident function of the profession, the preventive side should be as largely developed as possible. A fear had sometimes been expressed that the general practitioner was becoming only a finger-post, pointing one patient to an institution, another to a specialist, and so on. On the contrary, the work of the practitioner should become more and more important. With recent years the phrase "the pretuberculous stage of tuberculosis" had been accepted, and though strictly speaking it was a contradiction of terms it conveyed quite a useful meaning. Similarly a preatheromatous stage of atheroma, a prenephritic stage of Bright's disease, or a prediabetic stage might also be spoken of. Ten years ago he had recommended to the Royal Commission on the Poor Laws that the general practitioner should have an advisory relationship to his patients, even in the absence of actual disease, but towards that end it was necessary that students should be educated on preventive lines. He had in view not so much the addition of fresh courses of study as the systematization of the teaching of the preventive side of medicine through the whole curriculum in connexion with existing chairs, such as that of zoology in respect of parasitology, that of physiology in respect of breathing, and eating and drinking and exercise, and that of practice of medicine. In the meantime, however, all he asked was that the Education Committee should be requested to consider and report on the system of medical education from this point of view. The country was now alive as it never had been before to the national importance of the physical welfare of individuals; it also was realizing as it never had before the value of the services which the medical profession might render to the nation, and he thought the General Medical Council would

be doing its best work in the direction of national reconstruction if it were to take into consideration the development of medicine on the lines indicated.

Dr. ELLIOT SMITH, in seconding, said that much of the teaching in medicine, surgery, and pathology was already preventive; at the same time it would be an advantage to consider the matter and make suggestions as to further developments. The experience of the last four years had shown the enormously wide range of preventive medicine. It was not for the Council to dictate to the schools as to how they should do their teaching, but it would serve a very useful purpose, even if only in stimulating attention to the subject, for the Committee to submit a series of questions.

Sir JOHN MOORE warmly supported the proposition, but suggested that the words "and in clinical hospitals" should be added after the words "medical schools." He thought that it was at the bedside of the sick that this teaching was needed.

Sir ARTHUR NEWSHOLME said that Dr. McVail had raised a matter of national importance. Already a large part of the teaching in medical schools was along the lines of preventive medicine, but it was asked that this should be increased and made more obvious.

Dr. NORMAN MOORE said that if an inquiry were made it would not be sufficient to look through a collection of calendars and prospectuses of the several schools. The whole condition of medical learning would have to be studied, and cognizance would have to be taken of the kind of men the schools were turning out. It was not a case of adding this or that course to the curriculum, but of discovering whether the present teaching in this respect was stagnant or (as he fully believed) progressive. Already the curriculum was overloaded with subjects, and one rose in despair from any attempt to reduce it.

Dr. MACKAY said that they all felt that the teaching must be more and more directed towards practice, and the physiologists and anatomists must think of their students as future practitioners. He believed that the teachers generally were interested in this subject, and in a way were doing their best to further it, and while he would not hinder the Education Committee from making the investigation proposed, he advised the Council not to expect any direct or immediate results.

The motion, with the addition of the words proposed by Sir John Moore, was carried *unanimously*, and Drs. McVail and Elliot Smith were added to the Education Committee for this purpose.

Finance of the Council.

Mr. C. S. TOMES, in moving the reception of the Finance Committee's report, said he thought the result was fairly satisfactory. The income of the General and Branch Councils for 1917 was £7,710 16s. 4d. and the expenditure £7,342 4s. 6d. Increased legal expenses were due to a good deal of correspondence with regard to complaints which did not materialize. The Council would be in the position of having a decreased income for the next few years owing to the smaller number of men qualifying and also to the general increase in expenses. The number of original registrations for 1917 (not including those on the Colonial and Foreign List) was 985. It was difficult to forecast the number for this year, but up to the present

there had been a slight falling off. A deficit of £130 on the Dental Fund was mainly due to the further drop of twenty-six in the number of original registration fees.

It was hoped that some means would be found of postponing the election of direct representatives this year. The cost of such an election would not be less than £800, and with so many medical men away from their homes it would be an unsatisfactory procedure.

DISCIPLINARY CASES.

Professional Relationship in Adultery Case.

The Council considered the case of Arthur Edward Gladstone, M.R.C.S., L.R.C.P., registered as of Plymouth, and now of Alexandria, New Zealand, who had been summoned on the charge of abusing his position as a medical practitioner by committing adultery and eloping with Mrs. Margaret Frances Hayo, whom and her husband and family he had attended professionally, subsequent to which he was co-respondent in the case of *Hayo v. Hayo* and Gladstone, a decree of divorce being pronounced in April, 1916, and afterwards made absolute.

The case was partly heard at the November session, when the evidence of Mr. Hayo was taken (SUPPLEMENT to the BRITISH MEDICAL JOURNAL, December 22nd, 1917, p. 125).

Dr. Gladstone was represented by counsel, Mr. Craig Henderson. In the absence of a complainant, Mr. C. J. S. Harper, the Council's solicitor, laid the documents before the Council, and said that Dr. Gladstone did not deny that he attended the Hayo family professionally up to July, 1914, on the 29th of which month Mrs. Hayo left home and went into lodgings which he found for her.

Captain Sydney Allen, R.A.M.C., of Dunedin, New Zealand, stated in evidence that it was impossible for Dr. Gladstone to come to England either in a civil or military capacity.

Mr. Craig Henderson read a declaration from Dr. Gladstone affirming that while medical attendant no improper relations existed between Mrs. Hayo and himself. The earliest act of adultery alleged in the divorce proceedings was in February, 1915, by which time he had for several months ceased to attend the Hayo family or engage in private practice.

After the Council had considered the case *in camera* the PRESIDENT said:

I have to announce that the Council has found that the facts alleged against Arthur Edward Gladstone have been proved to its satisfaction, that it has adjudged him to have been guilty of infamous conduct in a professional respect, and has directed the Registrar to erase his name from the *Medical Register*.

Convictions.

The Council considered, on May 30th, the case of George Harry Bishop, M.B., of Lemau Street, Aldgate, who was charged with having been convicted at the Central Criminal Court last October of conspiring with other persons to defeat the provisions of the Military Service Acts by enabling persons liable for military service to escape wholly or partially from that liability, and sentenced to twelve months' imprisonment without hard labour.

The Council's SOLICITOR said that he understood the facts were not denied. The manner in which the offence was carried out was by the administration of thyroid extract. Dr. Bishop was not present, but was represented by counsel, Mr. E. J. Purchase, who said he was not in a position to dispute the conviction, but urged certain circumstances in explanation and mitigation. Dr. Bishop was held in the highest respect by his patients and his fellow practitioners. The offence was an isolated lapse by a man upon whom no shadow of suspicion had previously rested. There was no sort of bribe, no considerable payment of any kind. But in a weak moment he lent himself to this act; he had been accustomed to use thyroid extract in his practice very extensively. He was made a tool of by other men, and himself played a comparatively small part in the conspiracy, which had begun long before he knew anything about it. Testimonials from medical men as to Dr. Bishop's previous good character were put in, and a witness was called to speak of his careful and attentive work as medical officer to a local institution.

The SOLICITOR to the Council, in replying, said that while no considerable pecuniary reward had actually been received, the possibility of a number of future guineas in an East End practice like Dr. Bishop's might have had its influence.

After the Council had deliberated *in camera*, the PRESIDENT said:

I have to announce that, it having been proved that George Harry Bishop was convicted of the misdemeanour alleged against him in the notice of inquiry, the Registrar has been directed to erase his name from the *Medical Register*.

The Council next considered the case of John Henderson Bell, M.D., of Beaufort Mansions, Chelsea, who was summoned on the charge:

That being a registered medical practitioner you were convicted of the following misdemeanours, namely: (1) At the Marlborough Street Police Court on the 29th day of June, 1917, of unlawfully and wilfully attempting to produce a disease in one Albert Cyril Orr, a man belonging to His Majesty's Forces, contrary to the Defence of the Realm Regulations, and were sentenced to six months' imprisonment with hard labour; (2) At the Clerkenwell Police Court, on the 5th day of July, 1917, of unlawfully doing an act preparatory to the commission of the offence of unlawfully and wilfully producing a disease or infirmity in one Howard Hawkins, a man belonging to His Majesty's Forces, contrary to the Defence of the Realm regulations, and were sentenced to six months' imprisonment with hard labour; both sentences on your appeal to quarter sessions being modified to six months' imprisonment in the second division.

Mr. C. J. S. HARPER (Solicitor to the Council) stated that in this case Dr. Bell did not plead any extenuating circumstances, nor did he ask for mercy. He simply said he did not do that with which he was charged.

Mr. A. Neilson, who appeared for Dr. Bell, said that the evidence upon which the magistrate had convicted was to him, as a barrister, surprising. (A long argument ensued concerning the power of the Council to retry the case.) Continuing, Mr. Neilson said that the magistrate seemed to have felt satisfied that the injection of a quarter of a grain of morphine sulphate into Orr's knee was enough to cause disease in the knee; but counsel was told such was quite impossible. Moreover, the only supporting evidence was that of Orr himself and a policeman.

The President pointed out that the practice of the Council was to accept the conviction as a fact, and they were not empowered to retry the case, but had to decide whether the practitioner's name ought to be removed from the *Register*.

Mr. Neilson said that in the second case the evidence was that Hawkins's nose was examined through a speculum, and cotton-wool saturated with suprarenal extract was applied to the mucous membrane. The accusation here was, in fact, an act preparatory to the commission of an alleged offence, that of producing a disease. He then related Dr. Bell's personal and professional history during his seventeen years' practice since graduation. In Chelsea he had a comfortable and remunerative practice, so there was no question of pecuniary need as a temptation to dishonourable conduct. No man suddenly became a rascal. It was not until Orr complained of pain and faintness after manipulation that the morphine was injected on the inner aspect of the thigh, a little above the knee, and the man was then advised to go to a military hospital to rest his knee. Dr. Bell received a guinea; this was the only time he ever saw or treated the man. Three days later Orr went to the Australian Military Hospital and said he had fallen off an omnibus four days previously, and his knee was swollen and painful. He was found to be a deserter from France, having made use of another man's pass, and was now serving a term of imprisonment.

Mr. Harper pointed out that Dr. Bell's story differed from Inspector Wensley's.

The President asked Mr. Neilson to confine his remarks to generalities, as the inspector was not present to be examined.

Mr. Neilson said that in regard to the second case, that of Hawkins, Markham (one of Dr. Bell's patients) came to Dr. Bell and said that he knew somebody who had nose trouble, and he had recommended him to Dr. Bell, knowing him to have done much nose and throat work. Dr. Bell said he would see him at his surgery, but Markham asked that Dr. Bell should see the man at his house in Woodstock Street, and he went there with Markham, taking with him a head mirror, a nasal speculum, nasal forceps, a bottle of suprarenal extract, cotton-wool, a thermometer, and a stethoscope. There Dr. Bell saw an Australian, who was introduced to him as Trooper Burgess; but this was not his name, and he was in fact a warrant officer in the Australian military force. Dr. Bell adjusted his mirror and looked into Hawkins's nose, inserted the speculum, and examined with great care. Mucus was found in the right nostril, the left was normal. Dr. Bell wiped the mucus away with cotton-wool, and as there was evidence of congestion he applied wool dipped in suprarenal extract. Hawkins resisted this and nothing further was done. Within a minute Sergeant Brewer emerged with another officer from a cupboard. A surgeon, Captain Kenneth Shaw, came in and examined all the instruments Dr. Bell had brought, and said he found nothing available for performing an operation for the purpose of injuring the patient's nose. Mr. Harper here pointed out that Captain Shaw had found Hawkins's nose quite normal. Continuing, Mr. Neilson said no attempts were made to show that money had reached Dr. Bell in this relation; he received one guinea for the treatment of Orr. He (Mr. Neilson) considered that Dr. Bell had been made the cat's-paw of Markham.

Several witnesses testified to Dr. Bell's character. The Rev. Dr. Pentreath, late senior military chaplain at Malta, said he had never come across a more honourable man. Counsel put in a letter from Dr. S. A. Kinnier Wilson, of 14, Harley Street, who was unable to remain to give evidence in person, stating that he had known Dr. Bell intimately since 1902, and had often met him during his practice in Chelsea, in consultation and otherwise; he had the highest regard for his

professional attainments, and considered him a practitioner of sound judgement and straightforward probity.

Dr. Bell, in evidence, said that he simply examined the men as any doctor would do; he had done nothing to be ashamed of. The minute injection of morphine into the thigh could not produce any disease. Markham was a patient of his and nothing more, and Markham's recommendation of him to other patients he attributed to gratitude for what he had done for Markham's family. Orr did not say that the examination of his knee had any relation to military service. Hawkins's examination was not completed; the man behaved very strangely. He received a fee of one guinea for Orr, but for Hawkins nothing. Dr. Bell added that he did not claim to be a nasal specialist, but he possessed the necessary instruments for at least a proper examination of such cases. He was never asked, nor did he intend, to do anything improper, and no monetary offer had been made to him.

The Council deliberated on the case *in camera*, and upon the readmission of parties and strangers, the PRESIDENT said:

Dr. Bell, I have to announce to you that the Council does not see fit to direct the Registrar to erase your name from the *Medical Register*.

[The remaining proceedings of the Council will be reported later.]

British Medical Association.

CURRENT NOTES.

Notice.

In view of the increased postage rates, which came into force on June 3rd, the Medical Secretary does not propose in future to acknowledge the receipt of those communications and documents which in an ordinary way would simply receive formal acknowledgement. Exception will, of course, be made whenever an acknowledgement is asked for.

War Emergency Fund of the Royal Medical Benevolent Fund.

The following further subscriptions have been received from Divisions of the Association in response to the recent appeal, and have been passed on to the Treasurer of the War Emergency Fund. The names of individual subscribers are published monthly in the advertisement pages of the JOURNAL.

	£	s.	d.
Kesteven Division, per Dr. C. H. Robbs, Hon. Sec. (second list) ...	1	1	0
Worcester Division, per Dr. C. H. Pollard ...	52	10	0
Marlebone Division, per Dr. C. E. Wallis, Hon. Sec., and Mr. N. Bishop Harman, Chairman ...	21	0	0

Inquiry into Central Pool.

The following further contributions have been received from Panel Committees towards the cost of the inquiry undertaken by the Insurance Acts Committee into the constitution of the Central Pool:

	£	s.	d.
Lancashire Local Medical and Panel Committee ...	10	10	0
Portsmouth Panel Committee ...	5	5	0
Northumberland Local Medical and Panel Committee ...	5	5	0

Association Notices.

MEETING OF COUNCIL.

The next Meeting of Council will be held on Wednesday, June 26th, in the Council Room, 429, Strand, London, W.C. 2.—By order,

W. E. WARNE,

Acting Financial Secretary and Business Manager.

May 30th, 1918.

BRANCH AND DIVISION MEETINGS TO BE HELD.

EDINBURGH BRANCH: SOUTH-EASTERN COUNTIES DIVISION.—Dr. M. J. Oliver, Honorary Secretary (St. Boswells), gives notice that the annual meeting of the Division will be held at the Railway Hotel, Newtown St. Boswells, on Wednesday, June 19th, at 3.15 p.m., for: (1) Election of officers; (2) annual report and financial statement; (3) report of War Committee and re-appointment of Committee; (4) instructions to Representative at Representative Meeting.

METROPOLITAN COUNTIES BRANCH.—Mr. N. Bishop Harman and Captain Wilfred Kingdon, R.A.M.C. (Honorary Secretaries), give notice that the annual general meeting of the Branch will

be held at 429, Strand, W.C. 2. on Friday, June 28th, at 4 p.m. The business will be: (1) Report of scrutineers as to the election of new officers. (2) The annual reports of Council and of representatives of the Branch on the Central Council. (3) President's address, Dr. M. G. Biggs (Professional organization from the point of view of the general practitioner).

SOUTHERN BRANCH: PORTSMOUTH DIVISION.—Dr. J. H. Frederick Way, Honorary Secretary (151, Victoria Road North, Southsea), gives notice that the annual meeting of the Division will be held in the Medical Library, 25, Western Parade, Southsea, on Thursday, June 13th, at 3.30 p.m.

SOUTH WALES AND MONMOUTHSHIRE BRANCH.—Dr. L. Freeman Marks, Honorary Secretary (Brynheulog, Mumbles, Glam.), gives notice that the annual meeting of the Branch will be held at the General Hospital, Swansea, on Thursday, June 13th, at 3.30 p.m.

INSURANCE.

LOCAL MEDICAL AND PANEL COMMITTEES.

Birmingham.—At a meeting of the Panel Committee, on May 7th, it was decided to inform the London Panel Committee that, while fully agreeing with the principle laid down in the Whitley report, it was not possible at the present time to say whether consultation with Government departments should take the form of medical councils or should be conducted in some such way as at present undertaken by the Insurance Acts Committee. A letter from the Panel Medico-Political Union relating to the recent conference and increased remuneration, and suggesting an address to the Panel Committee by a member of their Council, was allowed to lie on the table. A resolution was received from the Small Heath Ward, maintaining that a pensions scheme for panel practitioners should now be initiated.

County Palatine of Chester.—The Local Medical and Panel Committee, on December 12th, 1917, resolved not to commit itself formally to the pledge (M. 19) issued by the British Medical Association, in view of the failure of the Insurance Acts Committee to carry out the intention of the October conference to put the scheme of collective bargaining into operation forthwith, but to inform the Insurance Acts Committee that "it may rely on our support in any strong action in connexion with the demand for the increased fee." At a meeting on April 6th, 1918, it was resolved to join the Association of Panel Committees. At a meeting on April 20th Dr. Hodgson gave a report of the proceedings at the April 11th conference. The resignation of the honorary secretary, Dr. Lionel Picton, on account of the decision of the Committee to join the Association of Panel Committees, was eventually withdrawn.

Staffordshire.—At a meeting of the Panel and Local Medical Committee, held at Stafford on April 26th, Dr. G. L. Lefevre (Longton) resigned his position as secretary in consequence of having accepted a commission in the R.A.M.C. The Chairman (Dr. T. Ridley Bailey) referred in glowing terms to Dr. Lefevre's work and the loss the Committee would sustain by his resignation of the post. Drs. Bull, Tibbets, and Wolverson endorsed the Chairman's remarks, and a presentation was made to Dr. Lefevre as a token of affection and esteem. Dr. W. L'Estrange Mathews (Bradley, Bilston) was appointed Secretary.

Durham County.—The Panel Committee has expressed the opinion that the formation of an Association of Panel Committees is unnecessary in view of the existing arrangements with the British Medical Association, and has recommended insurance practitioners in the area to support its view that the explanatory memorandum of the Association of Panel Committees cannot be accepted as a statement of facts nor can its suggestion of policy be acquiesced in.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty: Fleet Surgeons: C. T. Baxter to the *Indefatigable*; R. B. Campbell (temporary) to the *Crescent*, additional. Surgeon G. A. Finegao to *Sick Quarters*, *Shetley*. Temporary Surgeons: D. G. Churcher to the *Esperley*; D. L. Baxter to R.N. Division; J. F. M. Campbell to the *Diamond*; H. Millett to the *Lord Nelson*; H. T. Cubbon to the *Dreadnought*; G. O. Grant to the *Shannon*; F. B. Dutton to the *Commonwealth*. To be temporary Surgeon: H. J. Leviser.

ROYAL NAVAL VOLUNTEER RESERVE.

Surgeon Probationer J. E. Fishburn to the *Brisk*. To be Surgeon Probationers: S. A. Holling, J. J. Doyle, T. R. E. Hillier.

ARMY MEDICAL SERVICE.

Lieutenant-General Sir A. T. Sloggett, K.C.B., K.C.M.G., K.C.V.O., is placed on retired pay on completion of the term of his appointment as Director-General, June 1st.

Major-General (temporary) Lieutenant-General T. H. J. C. Goodwin, C.B., C.M.G., D.S.O., to be Director-General, and to be Lieutenant-General, June 1st.

Major-General W. G. Birrell and Colonel H. I. Pocock, C.M.G., retire on retired pay.

ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel P. H. Henderson, D.S.O., to be temporary Colonel whilst employed as Assistant Director of Medical Services of a Division, December 27th, 1917.

Temporary Lieut.-Colonel Harold W. Bruce, from Southwark Military Hospital, to be temporary Major on reposting, February 6th, 1918, with

seniority from November 1st, 1915 (substituted for notification in the *London Gazette* of February 18th, 1918).

T. S. Good to be temporary Lieutenant-Colonel whilst employed at the Ashurst War Hospital.

Captain H. W. Carson relinquishes the acting rank of Lieut.-Colonel and reverts to the acting rank of Major (with pay and allowances of his substantive rank), November 27th, 1917.

Captain G. H. Stack to be acting Lieut.-Colonel whilst in command of a medical unit.

Temporary Captains to be acting Lieut.-Colonels: (Acting Major) H. Moore, M.C., whilst in command of a medical unit; C. J. West, whilst specially employed.

Temporary Captains to be temporary Majors (without increased emoluments): J. F. Carruthers, J. F. O'Malley.

Temporary Captains relinquish the rank of acting Majors on re-posting: J. Watson, C. F. Drew, E. O. Abraham, M.C.

S. Ritson and David Wilson, late temporary Captains, are granted the honorary rank of Captain.

Temporary Lieutenant W. O. van Milligan to be temporary Captain.

The names of temporary Major Harold Waterlow Wiltshire and temporary Lieutenant Joseph L. Meynell are as now described, and not as in the *London Gazette* of August 7th, 1916, and July 2nd, 1917, respectively.

To be acting Majors:—Captains: V. T. Carruthers, D. C. Munro, O. R. McEwen, L. A. Andrews, H. F. Joynt, A. S. Cane, J. R. H. I.

Temporary Captains: A. G. Cook, A. P. Saint, M.C., T. Ferguson, J. A. Conway, M.C., W. Crabtree, J. R. Craig, W. M. Badenoch, J. H. Banks, R. K. Birnie, G. B. Holroyde, W. V. Macaskie, H. B. Atlee, M.C., J. Hughston, K. G. Fraser, W. K. McLutye, M.C., W. H. Pescod, J. H. McNicol, M.C., W. A. Rogerson, A. Dick, W. H. Welsh, C. G. Sutherland, J. P. Oord, A. R. Green, F. C. Tibbs, R. Scott, W. D. Cruickshank, A. C. Sturrock, G. D. Mathewson, A. G. Anderson, I. Jones, E. B. Gunson, W. T. Hessel, W. P. Ker, R. A. P. Hill, J. L. Gordon, L. D. Woods, C. A. H. Gee, R. S. Dewar, G. V. Bakewell, L. G. McCune, S. Campbell, D. I. Anderson, J. Alexander. Temporary

Lieutenants (temporary Captains) St. J. D. Buxton, J. F. Bourke, M.C. Temporary Lieutenants N. B. Stewart, W. B. Griffin.

To be acting Majors whilst specially employed: Captains A. Jackson, R. M. Dickson, H. G. Winter, M.C. Temporary Captains W. Martin, F. N. Brown, J. A. W. Waits, H. T. Newling, F. B. Young, W. A. Wheelton, J. D. Duncan, A. Griffiths. Temporary Lieutenant R. A. Oram.

Officers relinquish their commissions: Temporary Captains W. J. Hepworth, A. M. Kennedy, B. C. W. Pasco, E. L. Shelton Jones, and G. D. Cairns (on account of ill health contracted on active service and are granted the honorary rank of Captain); D. Simston (on account of ill health, and is granted the honorary rank of Captain); W. A. Edwards, L. B. W. Braine, R. W. Buchanan, H. C. Smyth, F. Shannon (and is granted the honorary rank of Captain); C. M. Rout. Temporary

Lieutenants C. H. Wagner (on account of ill health contracted on active service, and is granted the honorary rank of Captain), E. H. Smith, J. A. Lees, G. P. Norman.

R. F. H. Jones to be temporary honorary Lieutenant whilst serving with the Welsh Hospital, Nelly.

Temporary Lieutenant J. T. Cameron to take rank and precedence in the corps and in the army as if his appointment to that rank bore date April 18th, 1918.

Herbert Child, late temporary Captain, is granted the honorary rank of Lieutenant.

Temporary honorary Lieutenant W. A. Pride to be temporary honorary Captain whilst serving with the Crookston War Hospital.

INDIAN MEDICAL SERVICE.

Colonel W. H. B. Robinson, C.B., Inspector-General of Civil Hospitals, Central Provinces, to be Surgeon-General with the Government of Bengal.

Lieut.-Colonel D. T. Lane, M.D., has been permitted to retire from the service on account of ill health, with effect from March 29th.

Major E. O. Thurston posted as Residency Surgeon and *ex officio* Assistant to the Resident in Nepal, November 14th, 1917.

Lieut.-Colonel H. B. Melville has been posted as Residency Surgeon in Kashmir, November 12th, 1917.

Captains have been promoted to be Majors, August 1st, 1917: H. W. Pierpoint, W. D. H. Stevenson, H. P. Cook, W. J. Fraser, C. A. Gosson, R. H. Lee, W. A. Mearns, W. B. A. K. Cullen.

Major F. Norman White, O.I.E., A.D.G., I.M.S. (Sanitary), to officiate as Sanitary Commissioner with the Government of India, in addition to his own duties (December 1st, 1917).

Lieut.-Colonel R. Birr, M.V.O., O.I.E., V.C.S., granted privilege leave for three months combined with furlough for nine months.

The services of Lieut.-Colonel C. H. James, C.I.E., have been placed at the disposal of the Chief Commissioner, Delhi (September 29th, 1917).

The services of Major A. S. M. Peebles, M.D., have been placed at the disposal of the Government of Bihar and Orissa (December 15th, 1917).

The services of Lieut.-Colonel A. T. Gage are replaced at the disposal of the Government of Bengal (January 8th, 1918).

To be permanent Lieutenants (November 9th, 1917): H. S. Anand, S. D. Sondhi, M.C., M.B.

Major J. N. Walker, M.R.C.P., has been appointed Professor of Medicine, King George's Medical College, Lucknow, substantively *pro tempore* (December 15th, 1917).

Captains promoted to be Majors (February 1st, 1918): K. G. Gharpurey, P. S. Mills, M.B., D. C. V. FitzGerald, M.C., R. S. Kennedy, M.C., B. Higham, M.B., P. Hefferman, M.B., F. P. Vernicke, M.B., H. S. Hutchison, M.B., R. G. G. Croly, M.B., S. T. Crump, and J. M. Skinner, M.B.

Majors to be Lieut.-Colonels (January 28th, 1918): H. Kirkpatrick, F. D. S. Fayer, P. K. Chitale, T. Hunter, W. R. Batty, D.S.O., G. Hutchison, W. G. Liston, C.I.E., (Brevet Lieut.-Colonel) H. Boulton, R. W. Anthony, E. E. G. Tucker, G. E. Stewart, F. S. C. Thompson, T. S. Novis, J. W. Watson.

Lieut.-Colonel P. B. Haig has been posted as Agency Surgeon in the Eastern States of Rajputana (January 2nd, 1918).

ROYAL AIR FORCE.

MEDICAL BRANCH.

To be Lieutenants: G. M. Mellor, L. E. Stamm.

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Majors to be Lieutenant-Colonels: W. K. Steele, J. Olerke, J. H. P. Graham.

Captains W. Ranson, D.S.O. (Lieut.-Colonel R.A.M.C.T.F.), and J. L. W. Morris, to be Majors.

Captains to be acting Lieut.-Colonels whilst in command of a medical unit: (Acting Major) C. M. Page, A. T. Pitts, C. J. A. Griffin, (Acting Major) G. T. van der Vijver.

Captains to be acting Majors: J. G. Ronaldson, M.C., H. W. Matthy, R. L. Newell, D. Macie, M.C., C. D. M. Buckley, M.C., T. O. Graham, H. R. Friedlander, G. H. Stevenson, R. P. A. Kirkland, H. D. Rollinson, W. C. B. Meyer, W. Johnson, M.C., G. Marshall, J. R. Dale, W. H. H. Miles, P. A. Ashcroft, E. W. Bowell, A. D. Gorman, A. B. Black, W. Brown, N. S. Bruce, R. G. Battersby, L. W. Hughes, J. J. Muir, W. W. Newton, T. C. Murphy.

Captains to be acting Majors whilst specially employed: W. A. Thompson, M. W. Ruthven.

Lieutenants to be Captains: P. A. Buxton, H. W. H. Holmes, F. C. Taylor, T. L. Heath, C. G. S. Milne, Vidot, M.C., M. C. Joynt, T. P. Chapman, E. D. Roberts, E. V. Beale, J. M. Norman, A. L. Packman, J. A. Tolmie, S. A. T. Ware, H. J. Blampied, D. C. B. Nett, J. R. Harris, M. W. H. Miles, P. A. Ashcroft, E. W. Bowell, A. D. Gorman, A. B. Black, W. Brown, N. S. Bruce, R. G. Battersby, L. W. Hughes, J. J. Muir, W. W. Newton, T. C. Murphy.

To be Lieutenants: J. G. Lawn and H. A. Chodak from University of London Contingent O.T.C.; M. Chalmers, A. Kennedy, A. E. Cochran, W. S. L. McLeish, J. Nicolson, J. J. Treanor, and W. A. Walker from Glasgow University Contingent O.T.C., Second Lieutenant J. D'A. Champney from unattached list T.F., J. H. Tighe from Birmingham University Contingent O.T.C., N. E. ff. Keim from Bristol University Contingent O.T.C., J. Gilmore from Durham University Contingent O.T.C., G. M. S. Smith from Edinburgh University Contingent O.T.C., A. G. Mitchell and W. A. Jackson from Manchester University Contingent O.T.C., A. G. McColl, A. Piney, D. Macqueen, V. J. Perez, D. Taylor, G. H. Gidlow-Jackson, J. D. White.

OVERSEAS CONTINGENTS.

CANADIAN ARMY MEDICAL SERVICE.

Temporary Major E. S. Jeffrey, M.C., C.A.M.C., to be Deputy Assistant Director of Medical Services.

CANADIAN ARMY MEDICAL CORPS.

Temporary Major A. E. H. Bennett to be acting Lieut.-Colonel whilst specially employed.

Temporary Captain H. J. Williamson to be acting Major whilst specially employed.

Temporary Captain T. W. Moore, M.C., to be temporary Major.

VOLUNTEER FORCE.

City of Glasgow Medical Volunteer Corps.—Lieutenant M. Campbell (late R.A.M.C.) to be temporary Captain.

Lancashire Medical Volunteer Corps.—Temporary Major E. Quayle to be temporary Lieut. Colonel.

Lancashire Volunteer Regiment, 16th Battalion.—J. Holmes to be Medical Officer and temporary Lieutenant.

Leicestershire Volunteer Regiment, 2nd Battalion.—J. B. Foulds to be Medical Officer and temporary Captain.

Middlesex Medical Volunteer Corps: Motor Ambulance Conty.—To be temporary Captains: W. I. Atkinson, W. C. Davis, A. S. Powell, J. B. Johnson, C. G. Hare, A. Paul. To be temporary Lieutenants: H. G. Cottrell, L. C. Hudson.

Northamptonshire Medical Volunteer Corps.—F. A. Husbands to be temporary Lieutenant.

Northumberland Volunteer Regiment, 5th Battalion. Captain O. H. Evers (late R.A.M.C.) to be Medical Officer and temporary Captain.

Suffolk Motor Volunteer Corps.—R. Rendall to be Medical Officer and temporary Lieutenant.

Warwickshire Volunteer Regiment, 5th Battalion.—J. Frew to be Medical Officer and temporary Lieutenant.

West Riding Volunteer Regiment, 20th Battalion.—T. Johnstone to be Medical Officer and temporary Lieutenant.

Lancashire Volunteer Regiment, 17th Battalion.—Medical Officer and temporary Lieutenant W. A. Rice to be temporary Captain.

APPOINTMENTS.

DISTRICT MEDICAL OFFICERS.—F. H. de G. Best, M.R.C.S., L.R.C.P. (Edmonton Union), E. F. W. Buckell, M.R.C.S., L.R.C.P. (Isle of Wight Union), S. C. Clarke, F.R.C.S. (Shardlow Union), G. H. Garnett, M.D. (Edin. (Greenwich Union), E. M. Judge, L.S.A. (Medway Union), A. P. Laycock, M.B., B.C. (Cambs. (Fulham Parish), E. H. Milson, M.R.C.S., L.R.C.P. (Andover Union).

DIARY FOR THE WEEK.

THURSDAY.

ROYAL COLLEGE OF PHYSICIANS, Pall Mall East, S.W.—5 p.m., First Croonian Lecture, by Dr. W. Langdon Brown: Sympathetic Nervous System in Disease.

ROYAL SOCIETY OF MEDICINE.—Section of Odontology: Monday, 7.30 p.m., Sir St. Clair Thomson: Removal of a Child's Tooth from a Secondary Branchus by Lower Bronchoscopy. Section of Ophthalmology, 8 p.m., Dr. Lewis R. Yealland: Hysterical Disorders of Vision. Mr. P. C. Bardeley: A Bilocal for Myopes.

DIARY OF THE ASSOCIATION.

Date.	Meetings to be Held.
	JUNE.
11 Tues.	St. Helens Division, Annual Meeting (followed by Conjoint Meeting of Warrington and St. Helens Divisions).
12 Wed.	Kent Branch, Annual Meeting, Tonbridge, 3.30 p.m.
13 Thnr.	Portsmouth Division, Annual Meeting, Southsea, 3.30 p.m. South Wales and Monmouthshire Branch, Annual Meeting, Swansea, 3.30 p.m.
19 Wed.	London: Finance Committee, 2.30 p.m. South-Eastern Counties Division, Edinburgh Branch, Annual Meeting, Newtown St. Boswells, 3.15 p.m.
20 Thnr.	Conference of Scottish Local Medical and Panel Committees, Edinburgh (North British Station Hotel), 10.45 a.m.
25 Wed.	London: Council Meeting.
23 Fri.	Metropolitan Counties Branch, Annual General Meeting, 429, Strand, W.C.2, 4 p.m.

GENERAL COUNCIL

OF

MEDICAL EDUCATION AND REGISTRATION.

SUMMER SESSION, 1918.

Sir DONALD MACALISTER, K.C.B., President,
in the Chair.

Election of Committees.

The following committees were elected:

Executive Committee: The President (*ex officio*), Dr. Norman Moore, Sir Frederick Taylor, Mr. Tomes, Dr. Langley Browne, Mr. Hodsdon, Dr. Norman Walker, Sir John Moore, Sir Arthur Chance.

Penal Cases Committee: The President (*ex officio*), Mr. Tomes, Sir Francis Champneys, Dr. Norman Walker, Sir Bertram Windle.

Business Committee: Dr. Norman Moore, the President, Dr. Macdonald, Dr. Norman Walker, Dr. Magennis.

Pharmacopoeia Committee: The President, Dr. Norman Moore, Dr. Caton, Dr. Barrs, Dr. Cash, Dr. Norman Walker, Sir John Moore, Dr. Kidd, Dr. Hopkins.

Finance Committee: Mr. Tomes, the President, Sir Frederick Taylor, Mr. Hodsdon, Sir Arthur Chance.

Dental Committee: The President, Mr. Waring, Mr. Tomes, Mr. Hodsdon, Sir Arthur Chance.

Dental Education and Examination Committee: Mr. Tomes, the President, Mr. Waring, Mr. Hodsdon, Dr. Knox, Sir Arthur Chance, Dr. Symington, Sir Arthur Newsholme (for special business).

Students' Registration Committee: Dr. Norman Moore, the President, Dr. Langley Browne, Dr. Mackay, Dr. Littlejohn, Sir Bertram Windle, Dr. Kidd.

Examination Committee: Sir F. Taylor, Dr. Elliot Smith, Dr. Caton (English Branch Council), Dr. Russell, Dr. Cash, Dr. Norman Walker (Scottish Branch Council), Sir John Moore, Sir A. Chance, Dr. Kidd (Irish Branch Council).

Education Committee: Dr. Norman Moore, Dr. Barrs, Sir F. Champneys (English Branch Council), Dr. Mackay, Mr. Hodsdon, Dr. Knox (Scottish Branch Council), Sir A. Chance, Sir B. Windle, Dr. Dixon (Irish Branch Council).

Public Health Committee: Sir A. Newsholme, Dr. Letimer, Mr. Verrall (English Branch Council), Sir D. MacAlister, Dr. Littlejohn, Dr. McVail (Scottish Branch Council), Sir John Moore, Dr. Magennis, Dr. Coey Bigger (Irish Branch Council).

The reports of committees were taken on May 31st. Each of the reports in turn was received, approved, and entered on the minutes.

Annual Tables of Examinations.

Dr. NORMAN WALKER presented the Examination Committee's analysis of the annual tables for 1917, showing the results of the professional medical examinations in medicine, surgery, and midwifery, by the conjoint boards and the several universities.

Of the twenty-three examining bodies, thirteen did not allude to the subject of operative surgery, five gave the passes and rejections, four stated that the subject was included under surgery, and one that the examination was suspended during the war; twelve did not allude to the subject of ophthalmic surgery or ophthalmology, four gave the passes and rejections, four stated that the subject was included in surgery, one that it was taken with final, one that the examination was suspended during the war, and one that there was no special examination in the subject; ten did not allude to the subject of mental diseases, seven gave the passes and rejections, five stated that this was included in medicine, and one that it had no special examination in the subject.

Sir JOHN MOORE drew attention to the discrepancy between the number of rejections in midwifery and in the other two subjects.

The British Pharmacopoeia.

Sir JOHN MOORE, in presenting the report of the Pharmacopoeia Committee, said that in order to restrict the use in pharmacy of certain oils and fats required for other purposes the use of alternative bases for official liniments, ointments, and the like had been sanctioned. An intimation was published in the *Gazettes* and included in copies of the *Pharmacopoeia* withdrawing certain substances and directing the substitution and modification of others. Regret was expressed at the deaths of Sir George Hare Philipson, an assiduous member of the Committee, and of Dr. Joseph Price Remington of Philadelphia, whose labours for the assimilation of the British and American *Pharmacopoeias* were warmly appreciated on both sides of the Atlantic.

School Examinations in India.

Dr. J. Y. MACKAY reported, on behalf of the Education Committee, that in reply to a recent communication from the India Office the Under Secretary for India had been informed that the Council would recognize as qualifying pupils for admission to the *Students Register* all school examinations in India which were accepted by any Indian university as equivalent to its own matriculation examination, on the same terms and subject to the same conditions as those on which that examination was recognized by the Council. That was the invariable rule of the Council in such cases. It was added that suggestions made by any of the universities of India for the modification of the regulations which at present applied to Indian preliminary examinations would be carefully considered by the Council.

Students' Registration and Approval of Institutions.

Dr. NORMAN MOORE presented the report of the Students' Registration Committee on exceptional registrations and the antedating of the commencement of professional study.

The number of medical students whose registration had been antedated since November, 1917, was 75. The Committee had resolved, satisfactory evidence as to visitation having been received, to add King Edward VI Grammar School, Southampton, and University College School, Hampstead, both of which were recognized by the English Conjoint Board, to the list of recognized institutions approved by the Council.

Validity of Certificates.

Sir JOHN MOORE brought forward a report of the Public Health Committee on various matters remitted to it. The Council agreed, on the recommendation of the Committee, following upon a letter from Surgeon-General M. P. Holt, D.M.S. British Salonica Force, that certain certificates granted to Special Reserve, Territorial, and temporarily commissioned officers should remain valid for examination purposes after the officers in question had been demobilized or had resigned their commissions.

The Apothecaries' Hall of Ireland.

Dr. NORMAN WALKER, on behalf of the Examination Committee, brought forward the report of Dr. William Boxwell on the examinations of the Apothecaries' Hall of

Ireland; also the report by Dr. R. J. Rowlette for the period May-July, 1917, when Dr. Boxwell was absent on service. Certain remarks of the reporters as to the examination in pathology (which was stated by Dr. Boxwell to be definitely below the standard required by any other licensing body he knew of), and also some criticisms in respect to procedure at other examinations, were regarded by the Committee as calling for the most careful consideration of the Apothecaries' Hall.

Dr. MAGENNIS said he did not object to the reception of the report, but he doubted its value.

The Council decided to forward the report to the Apothecaries' Hall, and also to request the Hall to continue to furnish tables of exemptions from, and results of, examinations as heretofore.

Shortage of Dental Students.

Mr. TOMES said that the figures of dental registrations indicated the serious effect of the war upon the number of dental students entering on professional studies. The number of dental students registered in recent years was as follows:

1917 ...	143	1914 ...	294	1912 ...	336
1916 ...	158	1913 ...	361	1911 ...	280
1915 ...	217				

The number for 1917 was the smallest for any year since 1890. It was understood that the question was now receiving the attention of the Ministry of National Service.

Dental Nurses.

Mr. TOMES, Chairman of the Dental Education and Examination Committee, said that the Birmingham Education Committee had suggested the employment of dental nurses to assist in the school clinics. In all its correspondence on this subject the Council had carefully guarded the position by stating that the nurses must always be under the supervision of a registered practitioner. The Birmingham authorities had quite fallen in with this view; the position of these dental nurses would be precisely analogous to that of hospital nurses undertaking surgical dressings according to the instruction of a surgeon.

The Council endorsed the action taken by the Chairman of the Dental Education Committee in approving the proposed arrangements.

Appointment of General Registrar.

On the motion of Dr. NORMAN MOORE, Lieutenant-Colonel Norman King was reappointed General Registrar, and Mr. A. J. Cockington to serve as Acting Registrar.

The Council then sat *in camera* to discuss the reports of the Office Site and Emergency Committees and other business.

DISCIPLINARY CASES.

Giving Certificates without Personal Examination.

On May 29th the Council considered the case of Frederick William Salter, L.R.C.P., L.R.C.S., of New Mills, Newtown, Montgomery, who was charged with giving certificates, between January and June, 1917, as to the health of a man liable under the Military Service Acts (whereby he was able for a time to avoid service) without seeing or examining him. The case was adjourned from the November, 1917, session, when the Council decided that Dr. Salter had given certificates which were misleading and improper, but postponed judgement.

Dr. Salter's counsel now produced letters from four medical practitioners in Dr. Salter's neighbourhood, all holding official positions, who spoke in favourable terms as to his character and conduct in the interval, and further, Dr. Salter put in a statutory declaration as to his conduct. It was stated on behalf of Dr. Salter that he had seen the man on several occasions previous to the giving of the first of the seven certificates, and understood his condition, and further, that the man, after being taken for the army, had now been discharged as unfit. The complainant, the Deputy Commissioner of Medical Services, Ministry of National Service, did not offer further evidence.

After the Council had deliberated *in camera* the PRESIDENT said:

Mr. Salter, I have to inform you that the Council, having taken into consideration your expression of regret, the assurances as to your future conduct which you have given in your

declaration, and the certificates as to character which have been furnished by four of your professional brethren, has not seen fit to direct the Registrar to erase your name from the *Medical Register*.

Professional Relationship.

The Council on May 30th and 31st considered the case of Frederic Cecil Robinson, M.R.C.S., L.R.C.P., of Carshalton Road, Sutton, who had been summoned on the charge that, being a registered medical practitioner, he abused his position by writing improper letters to Mrs. Maureen Alexander, whom he was attending professionally, and, with a view to entering into immoral relations with her, by meeting her clandestinely, and by paying her improper attentions. Dr. Robinson was present with his counsel, Mr. E. W. H. Jones, and the complainant, Mr. C. S. Alexander, was represented by Mr. Storrey Deans.

Mr. Deans stated that in January, 1915, Dr. Robinson was called in to attend Mrs. Alexander; he attended her also in October, 1916, and her husband in May, 1917. In the autumn of 1917 Mr. Alexander discovered a letter addressed to his wife by Dr. Robinson, and two other letters were afterwards discovered. Mr. Alexander gave evidence as to professional relationship. Dr. James Calvert testified favourably to Dr. Robinson's general and professional character. Dr. Robinson, in evidence, said that he was very much ashamed of the letters which had been written, and that all correspondence and meetings had now ceased. The letters, which were undated, he assigned to July-October, 1917.

Mr. Jones, for Dr. Robinson, said he had no word in defence of the letters; but, however foolish they were, they contained no suggestion of indecency. The last professional attendance by Dr. Robinson on Mrs. Alexander was in October, 1916. As the date of the earliest letter was July, 1917, the charge of professional misconduct fell to the ground. Mr. Storrey Deans, in reply, pointed out that the July letter, the first of those obtained, was sufficiently intimate in its terms to show that the attentions had been going on for some time.

After the Council had deliberated *in camera*, the PRESIDENT announced its finding as follows:

Mr. Robinson, the Council have found the following facts alleged against you in the notice of inquiry to have been proved to their satisfaction: that being a registered medical practitioner, you abused your position by writing improper letters to Mrs. Alexander, whom you were attending professionally, by meeting Mrs. Alexander clandestinely, and by paying her improper attentions. Having found these facts to be proved, they have now judged you to be guilty of infamous conduct in a professional respect, and have directed the Registrar to erase your name from the *Medical Register*.

Charge against Dentist of Assisting in Unqualified Practice.

The Council considered, on May 28th, a charge against Bertram Douglas Black, a registered dentist, of having been employed by or associated with an unqualified person carrying on dental practice in Ireland. This unqualified person had widely advertised his practice in newspapers and elsewhere, and had been convicted at the instance of the Irish Branch of the British Dental Association of unlawfully using the letters D.D.S., U.S.A. The complainants were the British Dental Association. The Dental Committee reported that Mr. Black admitted that he had for some months been employed by this unqualified person, but that he had severed his connexion with him. He maintained, moreover, that he had been employed in the workshop, acting only occasionally as assistant, and had made it a condition that the fact of his being qualified should not be used to further the business. The defendant apologized to the Council, and promised that there should be no cause for complaint in the future; and on this undertaking the President, after the Council had considered the case *in camera*, announced that although there was no doubt that the defendant had been guilty of foolish and reprehensible conduct, the Council did not see fit to erase his name from the *Register*.

After the hearing of disciplinary cases and the passing of certain formal resolutions as to procedure, the Council rose, having concluded its session.

THE Insurance Commissioners have made regulations applying the provisions of the Arbitration Act, 1889—in so far as they relate to the costs of an arbitration, attendance of witnesses, and production of documents—to inquiries relating to medical practitioners and chemists, held under the National Health Insurance (Medical Benefit) Regulations (England), 1913. A schedule is attached showing the provisions of the Arbitration Act to be applied to such inquiries.

THE Central Committee of the Leicester Union of Medical Practitioners has passed a resolution welcoming medical inspection of children and young persons, but strongly urging that the treatment of all children and young persons as included in Clauses 18 and 19 of the Education Bill should be carried out by the general practitioners instead of by whole-time men appointed for that particular purpose.

INTOXICANT DRUGS FOR THE TROOPS.

IN the JOURNAL of December 15th, 1917, p. 797, we referred to the Army Council Order of May 11th, 1916, which prohibited any person from selling or supplying any article specified in the schedule to the Order to or for any member of His Majesty's forces, unless ordered for him by a registered medical practitioner on a written prescription, dated and signed by the practitioner with his full name and qualifications, and marked with the words "not to be repeated," and unless the person so selling or supplying marked the prescription with his name and address and the date on which it was dispensed.

That Order has been revoked by a new Army Council Order dated June 5th, 1918, which limits the restriction to any member of His Majesty's forces *not being a registered medical practitioner, or registered dentist, or registered veterinary surgeon*, and imposes the following conditions in respect of selling, giving, procuring, or supplying, or offering to sell, give, procure, or supply, any of the specified drugs to other members of His Majesty's forces:

(a) The drug must be supplied on and in accordance with a written prescription by a registered medical practitioner, dentist, or veterinary surgeon, and dispensed by a person legally authorized to dispense such prescription.

(b) The prescription must be dated and signed by the medical practitioner, dentist, or veterinary surgeon, with his full name and address and qualifications, and marked "not to be repeated," and must specify the total amount of the drug to be supplied on the prescription, except that in the case of a proprietary medicine it is sufficient to state the amount of the medicine to be supplied.

(c) The drug must not be supplied more than once on the same prescription.

(d) The prescription must be marked with the date on which it is dispensed, and retained by the dispenser. It must be kept on the premises where it is dispensed, and be open to inspection by authorized persons.

(e) The ingredients of the prescription, together with the name and address of the person to whom they are supplied, must be entered in a book set apart for this sole purpose kept on the premises where the prescription is dispensed, and open to inspection by authorized persons.

It should be noted that the new Order does not supersede or modify the requirements of Defence of the Realm Regulation 40 B in regard to opium or cocaine, which must still be complied with.¹ The schedule to the new Order is almost identical with that to the Order of May 11th, 1916. The drugs specified are:

Barbitone.	Codeine.
benzamine lactate.	Diamorphine.
Benzoamine hydrochloride.	Indian hemp.
Chloral hydrate.	Opium.
Coca.	Morphine.
Cocaine.	Sulphonal and its homologues;

and any salts, preparations, derivatives, or admixtures prepared from or with any of the above mentioned drugs.

Association Notices.

ANNUAL REPRESENTATIVE MEETING, 1918.

Date of Meeting.

THE Annual Representative Meeting of the Association will be held at the Connaught Rooms, Great Queen Street, Kingsway, W.C. 2, on Thursday, July 25th, at 10 a.m., and following day(s) as may be required.

Returns of Representatives.

Honorary Secretaries who have not yet forwarded to the head office the names and addresses, and dates of election, of the Representatives appointed by their constituencies for 1918-19, are reminded that these particulars should be forwarded to the Medical Secretary by the earliest possible date. Under By-law 35, Representatives must be elected not more than nine months nor less than four weeks before the A.R.M., and their names notified to the head office by at latest July 4th. The Representative can, if necessary, be elected and instructed by one and the same meeting of the constituency.

Agenda of A.R.M.: Further Notices of Motion by Divisions and Branches.

The Recommendations contained in the annual report of the Council, 1917-18, were published in the SUPPLEMENT of May 4th (a copy of the full report is being sent post free to every member applying for it). Notices of Motion by Divisions and Branches were published in the SUPPLEMENT of May 25th. Any Recommendations contained in the supplementary report of the Council will be published in the SUPPLEMENT of July 6th. There will also be included in the final agenda of the Meeting, to be issued to the members of the Representative Body on or about

July 18th, not only the Recommendations and Notices of Motion above referred to, but also all Notices of Motion received up to Thursday, July 11th, found by the Agenda Committee to be in order.—By order,

ALFRED COX,

Medical Secretary.

June 12th, 1918.

MEETING OF COUNCIL.

THE next Meeting of Council will be held on Wednesday, June 26th, in the Council Room, 429, Strand, London, W.C. 2.—By order,

W. E. WARNE,

Acting Financial Secretary and Business Manager.

May 30th, 1918.

BRANCH AND DIVISION MEETINGS TO BE HELD.

EDINBURGH BRANCH: SOUTH-EASTERN COUNTIES DIVISION.—Dr. M. J. Oliver, Honorary Secretary (St. Boswells), gives notice that the annual meeting of the Division will be held at the Railway Hotel, Newtown St. Boswells, on Wednesday, June 19th, at 3.15 p.m., for: (1) Election of officers; (2) annual report and financial statement; (3) report of War Committee and re-appointment of Committee; (4) instructions to Representative at Representative Meeting.

LEINSTER BRANCH.—Mr. William Doolin, F.R.C.S.I. (50, Fitzwilliam Square, Dublin), gives notice that the annual meeting of the Branch will be held in the Irish Offices of the Association, 16, South Frederick Street, Dublin, on Monday, June 24th, at 5 p.m., to be followed by meetings of the Dublin and East Leinster Divisions.

SOUTH MIDLAND BRANCH: BUCKINGHAMSHIRE DIVISION.—Dr. H. J. Henderson, acting Honorary Secretary (Alwyns, Amersham), gives notice that the annual meeting of the Division will be held at the Red Lion Hotel, High Wycombe, on Thursday, June 20th, to which all practitioners are invited, at 2.15 p.m. (lunch at 1.30). Tea will be provided.

SOUTH-WESTERN BRANCH.—Major Russell Coombe, acting Honorary Secretary, gives notice that the seventy-ninth annual meeting of the Branch will be held on Wednesday, June 19th, at the Royal Devon and Exeter Hospital, Exeter, at 3 p.m. In view of the continuance of the war the meeting will be restricted to formal business, but a communication from the Central Office with regard to the possibility of putting forward one or more medical candidates for Parliament will be read, and its contents will be open for discussion and the passing of resolutions.

KENT BRANCH: ISLE OF THANET DIVISION.—Dr. G. E. Halstead, Honorary Secretary (Albion Hill House, Ramsgate), gives notice that the annual meeting of the Division will be held at Dr. Nichol's house, 1, Ethelbert Terrace, Margate, on June 20th, at 4.15 p.m. Agenda: Ethical rules, and usual annual business.

EDINBURGH BRANCH.—Drs. John Stevens and John Eason, Honorary Secretaries (78, Polwarth Terrace, Edinburgh), give notice that the annual meeting of the Branch will be held in the Hall of the Royal College of Surgeons of Edinburgh, Nicolson Street, on Tuesday, June 25th, at 4 p.m. (tea at 3.45 p.m.). Business: Report of Branch Council; annual report of Branch and Divisions; financial statement. Election of officers, etc. Scottish Committee. War emergency (the Military Service (No. 2) Act, 1918, as affecting the medical profession; report of action of Branch Council). Annual report of Council.

Meetings of Branches and Divisions.

DORSET AND WEST HANTS BRANCH.

THE annual meeting of the Branch was held at Bournemouth on May 15th, when Dr. FORSTER, Vice-President (in the absence of the President), was in the chair. The HONORARY SECRETARY, in presenting the annual report, stated that in spite of increasing difficulties owing to prevailing conditions, the usual meetings of the Branch had been held during the year. The membership of the Branch showed a decrease of five, and the financial statement showed a balance in hand of £15 19s. 7d. The election of officers for 1918 was announced as follows:

President: Dr. H. Simmons (Bournemouth). *Vice-Presidents:* Dr. Willans (Bournemouth), and Dr. Luther (Puddletown). *Honorary Secretaries:* Dr. F. Fowler and Mr. P. A. Ross.

THE PRESIDENT-ELECT, in the course of a short address on the work of the Association, put forward a strong plea for the whole-hearted support by the profession of the leaders of the Association, and suggested a distribution of a summary of the work of the Council and its various committees (whose report he recommended every member of the Branch to read) to all non-members as well as members, and also a modification of the terms of subscription for those wishing to participate only in the medico-political side of the Association's work.

¹ BRITISH MEDICAL JOURNAL, November 17th, 1917, p. 657.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

CURRENT NOTES.

Medical Practitioners and Reduction of Lighting, etc.

On the instruction of the Medico-Political Committee a communication was recently addressed to the President of the Board of Trade urging that as paragraph 8 of the Lighting, Heating, and Power Order, 1918, exempted hospitals and bona fide nursing homes from the provision of Part II of the Order (which laid down that in any quarter of the present year only five-sixths of the amount of electric light or gas could be used of the amount used in the equivalent quarter last year) medical practitioners should be exempted from provisions of the Order as regards the use by them of gas and electricity for lighting, power, and heating purposes so far as their professional consumption thereof can be differentiated from their private consumption. A reply has been received that the Board of Trade is prepared, in cases where medical practitioners find themselves unable by reason of their professional needs to effect the economy prescribed by the above Order, to accept this as a sufficient explanation under paragraph 14 of the Order, which runs as follows:

Proceedings for infringements of Part II of this Order shall not be instituted except by or by the direction of the Board of Trade or the Attorney-General. Before instituting any proceedings the Board of Trade shall call upon the person affected to give an explanation of the apparent excessive consumption, and the Board shall consider any explanation offered. Provided that it shall be assumed in any prosecution, unless the contrary is proved, that such explanation was called for and, if offered, considered before such prosecution was instituted.

War Emergency Fund of the Royal Medical Benevolent Fund.

The following further subscriptions have been received from Divisions of the Association in response to the recent appeal, and have been passed on to the Treasurer of the War Emergency Fund. The names of individual subscribers are published monthly in the advertisement pages of the JOURNAL.

Meetings of Branches and Divisions.

GRENADA BRANCH.

DURING the past year four meetings of the Branch were held. Three of these were mainly concerned with the Venereal Diseases Ordinance, which is now practically complete and has been sanctioned for one year on trial. The other meeting of the Division was convened to bid farewell to Dr. N. S. Durrant on his retirement on pension from the service; he was presented by the President of the Branch with an address signed by the medical officers of the colony and a sum of money with which to purchase a piece of plate as a memento of his labours there.

GLASGOW AND WEST OF SCOTLAND BRANCH.

THE annual general meeting of the Branch was held on May 23rd, when Dr. W. S. SYME, the President, presided. The Secretary's and Treasurer's reports were read and adopted. The President then vacated office in favour of the President-elect, Dr. Lawrie, to whom he referred in felicitous terms. Dr. Snodgrass was unanimously appointed President-elect, and Drs. W. F. Brown and W. S. Syme Vice-Presidents. The Secretary and Treasurer were also duly appointed, and the interim Honorary Secretary agreed to continue his work as such. On the motion of Dr. SNODGRASS it was decided to look into the matter of the infliction of penalties by the National Insurance Commissioners.

METROPOLITAN COUNTIES BRANCH: MARYLEBONE DIVISION.

At the annual general meeting of the Division, held on May 15th, when the Chairman, Mr. BISHOP HARMAN, was in the chair, the following officers were elected:

Chairman: Major McAdam Eccles. Vice-Chairman: Dr. C. O. Hawthorne. Honorary Treasurer: Dr. Comyns Berkeley. Honorary Secretaries: Mr. N. Bishop Harman and Mr. C. Edward Wallis. Representatives in Representative Body: Dr. C. O. Hawthorne, Major McAdam Eccles, Mr. Bishop Harman, Mr. C. Edward Wallis. Deputies: Dr. Joseph Pollard, Dr. Jobson Horne. To the Branch Council: Dr. Mary Bell, Dr. Jobson Horne, Dr. Joseph Pollard, Mr. Charles Ryall.

The following nominations were agreed upon:—To Central Council: Dr. M. G. Biggs, Dr. H. B. Brackenbury, Sir Bertrand Dawson, Major McAdam Eccles. To Council of the Metropolitan Counties Branch: President-elect: Major McAdam Eccles. Vice-Presidents: Dr. James Berry, Dr. Comyns Berkeley, Dr. H. J. Cardale, Dr. H. J. Cooper. Honorary Treasurer: Mr. Betham Robinson. Honorary Secretaries: Mr. N. Bishop Harman, Dr. Wilfred Kingdon.

Annual Representative Meeting.—The Representatives were instructed as follows: (1) That the Council be requested to take into consideration the question of endeavouring to obtain a subvention from the Government towards the expenses of the Central Medical War Committee. (2) That, as agreed in 1917, the Division approves generally of the scheme for the establishment of a national Ministry of Health. (3) That in other matters Representatives be given a free hand to deal with situations as they arise.

MIDLAND BRANCH: HOLLAND AND KESTEVEN DIVISIONS.

At the annual meeting of the Holland Division, held on May 20th, when Dr. PILCHER was in the chair, the following officers were elected:

Chairman: Dr. Wrinch. Vice-Chairman: Dr. Witham. Secretary and Treasurer: Dr. R. Tuxford (re-elected). Representative on Branch Council: Dr. Wright (re-elected). Executive Committee: Messrs. Braithwaite, Husband, Morris, Munro, South, Walker, and White.

It was unanimously resolved to apply to the local Red Cross hospitals for payment to the members of the medical staff who were attached to them under Army Council Instruction 193 of 1918.

At a subsequent joint meeting of the Holland and Kesteven Divisions it was resolved to ask Dr. C. Frier (Grantham) to act as Representative at the next annual representative meeting of the Association.

SOUTH-EASTERN OF IRELAND BRANCH.

The annual meeting of the South-Eastern of Ireland Branch was held at Kilkenny on May 1st, with Dr. DENIS WALSH in the chair. The following officers were elected:

President: Dr. J. H. Jellett. *President-elect:* Dr. C. E. James. *Honorary Secretary:* Dr. Grace. *Honorary Treasurer:* Dr. Jellett. *Representative on Council of Association:* Dr. D. Walshe. *Representative in Annual Representative Body:* Dr. J. Power. *Deputy Representative:* Dr. Grace. *Representative on Irish Committee:* Dr. J. V. Ryan.

SOUTH-WESTERN BRANCH: TORQUAY DIVISION.

At the annual meeting of the Division, held on May 16th, the following were elected officers for the ensuing year:

Chairman, and Representative in Representative Body: Dr. H. Goodwyn. *Vice-Chairman:* Dr. H. V. McKenzie. *Honorary Secretary and Treasurer:* Dr. G. Young Bales. *Auditor:* Dr. H. V. McKenzie. *Representatives on Branch Council:* Drs. H. P. V. Wiggin and S. R. Williams. *Executive Committee:* Drs. J. Culross, G. J. Gibson, H. K. Lacey, and F. T. Thistle.

SURREY BRANCH: KINGSTON-ON-THAMES DIVISION.

At the annual general meeting of the Division, held on May 14th, it was agreed that the annual general meeting of next year should be held on the second Tuesday in May, and that no other general meeting should be called except to deal with such matters as might arise. The following officers were elected:

Chairman: Dr. R. N. Goodman. *Vice-Chairman:* Dr. A. Max Sully. *Honorary Secretary and Treasurer:* Dr. T. W. Letchworth. *Representatives (on Branch Council):* Dr. A. E. Evans; (in Representative Body): Lieut.-Colonel M. O. Coleman. *Executive Committee:* Drs. H. Cooper, G. Cowen, W. W. Groome, H. N. Holberton, F. B. Norris, A. B. Taylor, R. F. Walker, and Alderman Finny, M.D., J.P.

SUSSEX BRANCH: HORSHAM DIVISION.

At a meeting held at Horsham on May 23rd the following officers were elected:

Chairman: Dr. M. Vernon. *Vice-Chairman:* Dr. S. P. Matthews. *Representatives (on Branch Council):* Dr. F. Boxall; (in Representative Body, with Worthing and Chichester Division): Dr. Gostling (Worthing). *Secretary:* Dr. M. Vernon.

In the course of a discussion on the subject of a Ministry of Health, the necessity for such a Ministry was recognized and the proposals of the Association were generally approved, especially those for safeguarding the interests of the general practitioner.

With reference to the clauses of the proposed Education Bill to which the Association drew attention, it was decided to write to the member of Parliament for the division, or, in his absence on military service, to the member for the neighbouring division of Chichester, asking for his support in amending the bill where necessary in the interests of the profession.

ULSTER BRANCH: BELFAST DIVISION.

At the annual meeting of the Division, held on May 16th, the following office-bearers for 1918-19 were elected:

Chairman: Dr. H. J. Boyd (Hillsborough). *Representatives in Representative Body:* Drs. A. G. Robb and J. R. Davison. *Treasurer and Secretary:* Dr. W. L. Storey (Belfast). *Executive Committee:* Drs. W. M. Burnside, *M. F. Cabill, T. C. D. Cathcart, Foster Coates, J. Colville, *T. A. Davidson, *J. R. Davison, *D. Gray, *S. T. Irwin, R. W. Leslie, J. B. Moore, *A. G. Robb, J. Rusk, W. A. Wadsworth, R. Watt, J. A. Clarke, W. R. Davison, A. McN. D'Evelyn, *D. P. Gaussen, J. C. Loughridge, *R. Reid, G. St. George, T. M. Tate.

* On the Branch Council.

YORKSHIRE BRANCH: HARROGATE DIVISION.

The annual meeting of this Division was held on May 22nd, when the following officers were elected:

Chairman: Dr. Edgecombe. *Vice-Chairman:* Dr. Nimmo Watson. *Honorary Secretary:* Dr. Gibson. *Representative in Representative Body:* Dr. Hinsley Walker. *Representative on Branch Council:* Dr. Gibson. *Committee:* S. M. Boyd, Daggett, Garrad, Greenwood, Mackay, Hinsley Walker, Crawford, Watson, and Mantle.

A list of periodical publications, official reports, and Blue Books in the Library of the British Medical Association available for issue to members on loan has been printed, and copies can be obtained free on application to the Librarian at the house of the Association, 429, Strand, W.C.2. The regulations governing the loan of these publications are stated in the introduction to the list. The Library is open for consultation from 10 a.m. till 5 p.m. (on Saturdays till 2 p.m.).

Association Notices.

MEETING OF COUNCIL.

The next Meeting of Council will be held on Wednesday, June 26th, at 11 a.m., in the Council Room, 429, Strand, London, W.C.2.—By order,

W. E. WARNE,
Acting Financial Secretary and Business Manager.
May 30th, 1918.

ANNUAL REPRESENTATIVE MEETING, 1918.

Date of Meeting.

The Annual Representative Meeting of the Association will be held at the Connaught Rooms, Great Queen Street, Kingsway, W.C.2, on Thursday, July 25th, at 10 a.m., and following day(s) as may be required.

Returns of Representatives.

Honorary Secretaries who have not yet forwarded to the head office the names and addresses, and dates of election, of the Representatives appointed by their constituencies for 1918-19, are reminded that these particulars should be forwarded to the Medical Secretary by the earliest possible date. Under By-law 35, Representatives must be elected not more than nine months nor less than four weeks before the A.R.M., and their names notified to the head office by at latest July 4th. The Representative can, if necessary, be elected and instructed by one and the same meeting of the constituency.

Agenda of A.R.M.: Further Notices of Motion by Divisions and Branches.

The Recommendations contained in the annual report of the Council, 1917-18, were published in the SUPPLEMENT of May 4th (a copy of the full report is being sent post free to every member applying for it). Notices of Motion by Divisions and Branches were published in the SUPPLEMENT of May 25th. Any Recommendations contained in the Supplementary Report of the Council will be published in the SUPPLEMENT of July 6th. There will also be included in the final agenda of the Meeting, to be issued to the members of the Representative Body on or about July 18th, not only the Recommendations and Notices of Motion above referred to, but also all Notices of Motion received up to Thursday, July 11th, found by the Agenda Committee to be in order.—By order,

ALFRED COX,
Medical Secretary.
June 12th, 1918.

ANNUAL GENERAL MEETING.

NOTICE is hereby given by the Council that the Annual General Meeting of the British Medical Association will be held at the Connaught Rooms, Great Queen Street, London, W.C., on Friday, July 26th, 1918, at 2 o'clock in the afternoon. Business: (1) Minutes of last meeting. (2) Appointment of auditors (Messrs. Price, Waterhouse and Co. offer themselves for re-election). (3) Award of Stewart Prize. (4) Report election of President.—By order,

W. E. WARNE,
Acting Financial Secretary and Business Manager.
Dated this 20th day of June, 1918.
429, Strand, London, W.C.2.

BRANCH AND DIVISION MEETINGS TO BE HELD.

EDINBURGH BRANCH.—Drs. John Stevens and John Eason, Honorary Secretaries (78, Polwarth Terrace, Edinburgh), give notice that the annual meeting of the Branch will be held in the Hall of the Royal College of Surgeons of Edinburgh, Nicolson Street, on Tuesday, June 25th, at 4 p.m. (tea at 3.45 p.m.). Business: Report of Branch Council; annual report of Branch and Divisions; financial statement. Election of officers, etc. Scottish Committee. War emergency (the Military Service (No. 2) Act, 1918, as affecting the medical profession; report of action of Branch Council). Annual report of Council.

LEINSTER BRANCH.—Mr. William Doolin, F.R.C.S.I. (50, Fitzwilliam Square, Dublin), gives notice that the annual meeting of the Branch will be held in the Irish Offices of the Association, 16, South Frederick Street, Dublin, on Monday, June 24th, at 5 p.m., to be followed by meetings of the Dublin and East Leinster Divisions.

METROPOLITAN COUNTIES BRANCH.—Mr. N. Bishop Harman and Captain Wilfred Kingdon, R.A.M.C. (Honorary Secretaries), give notice that the annual general meeting of the Branch will be held at 429, Strand, W.C.2, on Friday, June 26th, at 4 p.m. The business will be: (1) Report of scrutineers as to the election of new officers. (2) The annual reports of Council and of representatives of the Branch on the Central Council. (3) President's address, Dr. M. G. Bigga (Professional organization from the point of view of the general practitioner).

SUSSEX BRANCH.—Dr. A. M. Dady, Honorary Secretary (14, Palmeira Avenue, Hove, Sussex), gives notice that the fifth annual general meeting of the Branch will be held in the Assembly Rooms, North Street, Chichester, on Wednesday, June 26th, at 2.15 p.m. Agenda: Election of officers, nominated by the Council; annual report with financial statement; Presidential address on "A Whole-time State Medical Service," to be followed by a discussion. The President-elect (Dr. Ernest H. Buckell, J.P.) will entertain members who intend to be present at the meeting to luncheon at West Pallant House at 1.30 p.m. Chichester members of the British Medical Association invite those attending the meeting to tea at 3.30.

WORCESTERSHIRE AND HEREFORDSHIRE BRANCH.—Dr. S. O. Legge, Honorary Secretary (24, Foregate Street, Worcester), gives notice that the annual meeting of the Worcester Division will be held at the Worcester General Infirmary on Tuesday, June 25th, at 3.30 p.m., and that the annual meeting of the Branch will be held at Hereford on Thursday, June 27th, at 3 p.m.

INSURANCE.

LOCAL MEDICAL AND PANEL COMMITTEES.

County of London.—At the meeting of the London Panel Committee, on May 21st, a recommendation was carried that practitioners who might be appointed by the Director-General of National Service for substitution work at a distance should have their practices safeguarded in the same way as men holding commissions—that is, by the restriction of the right of transfer of insured persons on their lists. It was decided that a fee of half a crown would be considered adequate for the furnishing of information in reply to inquiries from the Local War Pensions Committee as to the previous medical history of an invalided man. It was understood that the practitioners would not be asked for a professional opinion, but only for certain particulars as to the man's previous illnesses, and that the patient's written consent would be obtained to the furnishing of such a report by his medical adviser. The Committee further passed a recommendation that antogenous vaccines ought to be included in medical benefit, but that until provision was made for their manufacture on behalf of insured persons they should be supplied in the same way as other treatment of a specialist character—namely, by referring insured persons to the out-patient department of a hospital—and the costs should not fall on the drug fund as at present constituted.

Kesteven.—At a meeting of the Local Medical and Panel Committee, on May 21st, it was decided to subscribe two guineas from the voluntary levy fund towards the cost of the inquiry into the constitution of the central pool. The offer of the Council of the panel Medico-Political Union to address the Committee was not accepted. As all the members of the Committee are more or less concerned in rural practice, it was not considered necessary to appoint a special rural sub-committee.

Renfrewshire.—At a meeting of the Panel Committee, on April 24th, the report of the President of the Institute of Actuaries upon the constitution of the central medical pool was approved. It was agreed to distribute the extra mileage grant for 1917 in the same proportion as the main mileage grant. It was decided to ask the Glasgow Panel Committee to convene a local conference of Panel Committees or take other suitable action.

County of Forfar.—At a meeting of the Local Medical Committee, on May 31st, Dr. John Craig submitted his report of the proceedings at the April Conference in London. At a meeting of the Panel Committee on the same day a Special Committee was appointed with full powers to take steps to have the grievances of panel practitioners arising from the method of certification of illness of panel patients discussed and if possible redressed.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments and promotions are announced by the Admiralty: Staff Surgeon T. A. Smyth promoted to rank of Fleet Surgeon (especially for war services); Staff Surgeon A. B. Marsh to the *Crescent*. Surgeons (acting Staff Surgeons) to be Staff Surgeons: W. H. King, H. E. R. Stephens, F. C. Alton, D. Loughlin, D.S.O., C. F. O. Sankey, D. A. Mitchell, E. MacEwan, A. H. CURRENT NOTES.

Meeting of the Central Council.

A QUARTERLY meeting of the Central Council of the Association was held on June 26th, when the usual routine business was transacted and the Supplementary Report of Council was considered and approved.

The Order of the British Empire.

At the opening of the proceedings a resolution congratulating Dr. Cox on his appointment to be an Officer of the Order of the British Empire was unanimously adopted. The Chairman of Council, Dr. Macdonald, in moving the resolution, spoke of the devoted services of Dr. Cox to the British Medical Association in various capacities, and most recently as its Medical Secretary, and also of his labours as one of the Secretaries of the Central Medical War Committee. The honour conferred was, he said, a mark of the appreciation of his services in the latter capacity by the War Office, but it must also be taken to be a recognition of his work with other Government offices, and their appreciation of the position which the British Medical Association has attained as the representative organization of the profession. Dr. Verrall, Chairman of the Central Medical War Committee, who seconded the motion, spoke in a similar strain, praising Dr. Cox's work for the Committee and speaking of what he had done to consolidate the position of the Association in relation to Government departments. Dr. Cox, in thanking the Council, said that he had received many other evidences of the satisfaction with which the members of the Association had learnt of the honour conferred upon him, and added that it was specially gratifying to find it confirmed by the Council. Miss Lawrence, Assistant Secretary Central Medical War Committee, was also congratulated upon the honour of M.B.E. conferred upon her.

Medical Men and the Military Service Act.

The quarterly report of the Central Medical War Committee to the Council of the British Medical Association gave a summary of the medical situation under the Military Service Act, 1918. The Regulations made under this Act recognize the Committee as the sole tribunal for medical men in England and Wales, while the Committee of Reference retains its functions in respect of members of hospital and teaching staffs in the metropolis. As has been explained at some length in recent issues of the JOURNAL, the power to bring about the transference of medical men of military age from one area to another for civil work is obtained, under the Regulations, by limiting the kinds of exemption that may be granted by the medical tribunals. On what are technically known as "personal grounds" (serious hardship, ill health, or conscientious objection) the tribunal may grant absolute, temporary, or conditional exemption; but in applications on "occupational grounds"—that is, on a plea that instead of being employed on military service the applicant should be engaged on other work in which he is habitually employed, or in which he wishes to be employed—the tribunal is limited to one form of conditional exemption,

with the terms of which medical men must by now be familiar. Thus, one of the results of the hearing of applications would be to establish a pool of doctors who may be called upon whenever the Ministry of National Service, in consultation with the medical tribunals, considers they should either take a commission in the medical service of one of the Forces or engage in civil medical work elsewhere. This will enable the Committee to release for military service some of the younger men who up till now have had to be left in their practices because substitutes were not available. The Committee hopes that the statement of the Ministry of National Service and the letter addressed by the Committee to the Local Medical War Committees will have the effect of limiting the number of applications to those practitioners who, on personal grounds, feel that they have an exceptional claim for a form of exemption different from the "standard exemption" indicated above. A "certificate of protection" equivalent to the standard exemption will be offered to every practitioner when he receives notice of his right to apply formally for exemption. Acceptance of this certificate will place him at the disposal of the Minister acting on the advice of the medical tribunal, and his position will be the same as though he had applied to the tribunal and had received standard exemption. The hope is expressed that as many as possible of these liable to military service will acquiesce in this course. In this and in other matters the Central Medical War Committee will depend largely upon the help of the Local Medical War Committees. The immediate work before the Committee is summarized in two paragraphs:

1. During the last two months the usual flow of medical men into the army to supply vacancies caused by casualties, resignations, etc., has been greatly interfered with, owing to the necessity for waiting for the new Regulations. It will now be necessary to resume operations vigorously, and a call is at once being made on those areas which are relatively well supplied with men of military age to furnish men for commissions. The first step will be to call on the younger eligible men who can be spared without the provision of substitutes, but at the same time the Committee will proceed with the investigation of each area for the purpose of ascertaining how many, if any, can be made available for either military or civilian work. The next step will be to use some of the older men for the purpose of releasing men in areas from which without substitution no more could be spared with due regard to civil requirements.

2. The great increase in the number of men to be dealt with and the complexity of the problems involved in the substitution question have added greatly to the work of the Committee, and the Ministry of National Service has provided considerable assistance of an administrative and clerical nature, without which the additional work could not be done. An entirely new development is the temporary appointment by the Ministry of National Service, after consultation with the Committee, of a number of gentlemen who are to act as visitors to the local committees on behalf of the Central Committee and the Ministry, reporting to both bodies. These officers will attend the meetings of the Local Arrangements Subcommittee, the body by which the detailed work of assessment and calling up will be done, and will on behalf of that body visit local committees to advise and report as to the capacity of the areas concerned to spare more men, and the ways in which the necessary economies of medical man power can be brought about. The Central Committee believes that the services of these gentlemen will be extremely useful to it and to the local committees in this difficult and important work, and it is glad to report that it has been found possible to secure the services of Dr. B. A. Richmond of London (a member of the Central

Medical War Committee), Dr. C. H. Milburn of Hull, Dr. J. F. Walker, Secretary of the South Essex Local Medical War Committee; and Dr. James Pearse, formerly of Trowbridge, latterly a medical inspector of the National Health Insurance Commission.

Since the last report, Dr. Fulton, Chairman of the Demobilization Subcommittee, has attended a conference called by the military authorities to consider the best way of dealing with the question of the general demobilization of doctors at the end of the war. The subject is still under consideration, but it is probable that the matter will be dealt with by an interdepartmental committee, on which the Central Medical War Committee will be represented.

Association Notices.

BRANCH AND DIVISION MEETINGS TO BE HELD.

EAST YORK AND NORTH LINCOLN BRANCH: EAST YORKSHIRE DIVISION.—Mr. H. L. Evans, Honorary Secretary (101, Prince's Avenue, Hull), gives notice that the annual meeting of the East Yorkshire Division will be held in the board room of the Hull Royal Infirmary, on Tuesday, July 23rd, at 8.15 p.m.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.
